| 4  | Jose Lindo, ClimateTrade and ClimateCoin (GreenClimateDAO)                                     | Figure 0.1 – Please answer yes or no | ge              | No, I authorize comments to be attributed on my behalf, Jose Lindo, representing ClimateTrade and ClimateCoin (GreenClimateDAO).                                                                                                                                                                                                                                                                                                                                                                                                                               | I would like to encourage both human and financial help in order to translate this brilliant document into several languages. If not in the short term, I think it should be strongly considered. Maintain the regional effort that, for example, UNFCCC is making during its Climate Week. The diversity of gender and cultures in the Umbrella Body is very welcome but I feel that work should be done on the translation of these public oversight documents and the IC-VCM website itself.<br>We want to be referred to as Our 2050 World core team. |

| 11 | Individual/employee, Alliance of Small Island States (AOSIS) and the Least Developed Countries | Figure 0.1 – Please answer yes or no | ge              | (DC) Group, we encourage the Integrity Council for the Voluntary Carbon Market (IC- VCM, following the conclusion of the Paris rulebook at COP-26, to look favorably upon including elements of Article 6 guidance from the rulebook: a 5% share of proceeds for adaptation (SOP) to the Adaptation Fund, a 2% cancellation rate to contribute to an overall mitigation in global emissions, avoiding double counting, and application of methodologies reflecting conservative baselines, as recommended best practices in the voluntary carbon market (VCM). | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 11 | Individual/employee, Alliance of Small Island States (AOSIS) and the Least Developed Countries | Figure 0.1 – Please answer yes or no | ge              | Recognizing the enormous challenges we face from climate impacts, AOSIS, the LDC Group and other Parties advocated for the carbon markets to generate additional resources for adaptation and to help close the 2030 mitigation gap and limit warming to 1.5-degrees. We believe the VM can play a valuable role in this regard.                                                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 11 | Individual/employee, Alliance of Small Island States (AOSIS) and the Least Developed Countries | Figure 0.1 – Please answer yes or no | ge              | Alignment with Article 6 on these elements would not only benefit our countries, but also put the VCM in the vanguard of progressive instruments to tackle the climate emergency.                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 12 | Individual/employee, Alliance of Small Island States (AOSIS) and the Least Developed Countries | Figure 0.1 – Please answer yes or no | ge              | Submitted as part of stakeholder discussion. The Coalition for Rainforest Nations (CfRN) has supported the ICVCM and its predecessor TSVC, believing that proper oversight and regulation of the voluntary carbon markets can and must contribute to achieving global net-zero. To achieve this mission, the VCM must align with the principles, goals, and requirements of the Paris Agreement. We have sought to be proactive in our communications, bringing to this debate our deep understanding of the Paris Agreement, our mission of making forests worth more alive, and the voice of our 50+ member countries. We understand that the ICVCM is undertaking efforts to evolve the Core Carbon Principle (CCPs). Collectively we believe that ICVCM should accord the highest possible attention to those key issues that we have repeatedly highlighted and are critical to the success of carbon markets globally.                                                                                                                                                                                                                                                                                                                                                                                      | Critical Elements for the ICVCM Alignment with NDCs - Central to the Paris Agreement is nationally determined contribution or NDCs. The Paris Agreement requires NDCs to be transparently communicated (Articles 4.9 and 13) and updated every five years as part of the GST (Global Stock-Take) (Articles 3, 4.9, and 14). Each successive NDC should 'represent a progression beyond the Party's current nationally determined contribution and reflect its highest ambition' (Article 6.3). Financial Resources to Developing Countries – The Paris Agreement acknowledges that developing countries need financial help from developed countries to meet their obligations (Preamble, Articles 2.1c, 4.5, 6.6 & 9). Developed governments are seeking to push this obligation onto the private sector, and thus private-sector flows must be consistent with the Paris Agreement. Central to these flows is the need for transparent communications on funding sources and uses (Article 13). Key to the success of the financial flows is that they take 'into account country-driven strategies, and the priorities and needs of developing country Parties' (Article 9.4). This key element must be prioritized in current ICVCM thinking. Finally, the need for a share of proceeds and automatic cancellations (OMGE) are requirements of the 6.4 mechanisms (Article 6.6), and the methodology was finalized at CMA3 in the 6.4 Decision, paragraph 6. Therefore, the ICVCM should ensure transparent and verifiable disclosures around these matters. Agency given to developed countries - Building upon the above, the ICVCM must recognize the requirement to adjust NDCs for the international transfer of carbon credits (Article 6.5, CMA3 decisions on 6.2 and 6.4). Not all money is good money from the perspective of developing countries. They have the authority to determine which flows are consistent with their national programs to meet their NDCs. Once again, this principle is spelled out in Article 9.4 of the Paris Agreement. Article 6 decisions at COP26/CMA3 – The full implications of the Article 6 decisions should be fully understood by the ICVCM. Unfortunately, many market participants either don't understand or are purposefully misrepresenting the intentions of these decisions. |

The ICVCM must send a strong message that carbon credits that represent supposed mitigation activities from years prior to the adoption of the Paris Agreement (2015) have little impact on the need to keep the planet inside the cumulative global carbon budget.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 12 | Individual/employee, Alliance of Small Island States (AOSIS) and the Least Developed Countries | Figure 0.1 – Please answer yes or no | ge              | Aligning with the Paris Agreement The Paris Agreement is the best hope the planet has of averting the worst impacts of climate change. There is no viable Plan B. The voluntary carbon markets must be designed to help achieve its aims. Thus, all aspects of the voluntary carbon market must comply with this international treaty's principles, goals, and requirements. The ICVCM should ensure that the implementation of the Paris Agreement remains a primary goal. The TSVC process did not consider the Paris Agreement in its totality, but instead paid lip service by creating an "attribute" for carbon credits indicating if they have been "Authorized for Article 6 purposes". The ICVCM must address this oversight. We believe that any other direction will only be myopic and would point to a lack of clarity and understanding at the ICVCM of the Paris agreement. It must be noted that the Articles in the Paris Agreement cannot be read and interpreted in isolation. Thus, the approach the ICVCM has focusing only on certain elements Article 6 are fundamentally flawed. The ICVCM must provide complete clarity in its CCP and Assessment Framework as to how Articles 3, 4, 5, 6, 9, 13, and 14 will be taken fully into account, including the decisions at CMA3 on Article 6. | <ul style="list-style-type: none"> <li>Project level baselines -- All must align with national commitments under the Paris Agreement and thus have crediting terms of only 5 years, renewable twice for a maximum of 10 years. Forestry removal crediting is for 15 years, renewable twice.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

The TSVM process highlighted the key differences between projects and national programs, but the ICVM does not appear to have incorporated this into the CCPs or AF. The ICVM could efficiently address many current shortcomings by explicitly recognizing that only carbon credits from the 6.4 Mechanism (when fully operational) and other emission reduction mechanisms under the Paris Agreement, such as Article 5, are included in the CCPs. And that all international transfers of carbon credits must adhere to the Article 6.2 guidance. In the interim, only carbon credits approved by a host country under Article 5 and as an ITMO under Article 6.2 should be recognized in the CCPs. The ICVM could play an important role in getting the planet on a credible net-zero pathway. But this success depends on all carbon markets aligning with the Paris Agreement; currently, the ICVM does not. Nor is it aligned with keeping 1.5 degrees alive. However, the ICVM has time to rectify the blind spots around the Paris Agreement. The CfrN would like to engage further in creating this optimal outcome. |

| 14 | Individual/employee, Alliance of Small Island States (AOSIS) and the Least Developed Countries | Figure 0.1 – Please answer yes or no | te              | A quick notification for you. I’m following with interest the Integrity Council for Voluntary Carbon Market’s progress and according to Chairman Annette Nazareth the consultation paper for the Core Carbon Principles is expected for public review in July for 60 days with the target of issuing the final framework in December.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 14 | Individual/employee, Alliance of Small Island States (AOSIS) and the Least Developed Countries | Figure 0.1 – Please answer yes or no | te              | I wanted to double check the issue of double-entry accounting is being correctly treated because Aldyen said the last time she read the document she wasn’t convinced it was resolved. Remember that until now, every “credit” and “allowance” that is traded in both compliance and voluntary “markets” worldwide, is always double credited—first in the GHG source inventory (which might not be publicly viewable) of the credits source, and again in the credit or allowance buyer’s inventory. No balancing entry in the supplier’s inventory to reflect the fact that they sold real interest in -1TCO2e is made. i.e. If an entity offers to sell real interest in -1TCO2e to a 3rd party, the credit supplier should be required to: (1) publish their GHG inventory, and update that published inventory annually, and (2) add a balancing +1TCO2e to that inventory for each -1TCO2e of reduction or net sequestration they sell. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 14 | Individual/employee, Alliance of Small Island States (AOSIS) and the Least Developed Countries | Figure 0.1 – Please answer yes or no | te              | Apparently, the authors continue use to the words "Carbon Accounting" when they are describing how to establish the management information systems needed to trace, estimate and report supply chain carbon intensity. Clearly there are many types of "Accounting" throughout the entire edifice, but it would be tragic to waste all this energy and continue to forget the rudimentary error around ownership transfer.                  | 0                                                                                     |
| 14 | Individual/employee, Alliance of Small Island States (AOSIS) and the Least Developed Countries | Figure 0.1 – Please answer yes or no | te              | I see PwC, EY, Deloitte are all involved in the WEF First Mover Coalition so hopefully they are also being tasked with the discipline of double entry book-keeping in this case.                                                                                                                                                                                                                                                            | 0                                                                                     |

| 31 | Individual/employee, Coalition for Rainforest Nations                                          | Figure 0.1 – Please answer yes or no | ge              | A key point to understand about the voluntary carbon markets is that it is – as the name suggests – voluntary. It is driven by private sector actors, and is not regulated by governments or financial authorities. But unregulated should not mean fragmented or opaque, and it certainly should not limit the potential of the market to contribute as fully as possible to securing a liveable future for the planet and everyone on it. | Mindset change                                                                        |
| 31 | Individual/employee, Coalition for Rainforest Nations                                          | Figure 0.1 – Please answer yes or no | ge              | This seems to imply that Voluntary can't be Regulated. Maybe the ICVCM should encourage greater government oversight of this market. Can the ICVCM name one well functioning financial market that is not well regulated.                                                                                                                                                                                                                   | 0                                                                                     |

XXX is part of XXX Group, which has had clear climate-neutral targets since 2014. XXX has recently established a carbon markets advisory service with the aim of supporting access to, and scaling of, voluntary carbon markets through client-centric capital market solutions. This includes voluntary and compliance carbon markets trading, raising capital for strategic and financial market participants, and carbon advisory services in support of mergers and acquisitions, initial public offerings, and net-zero strategy execution.                                  |

| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | XXX welcomes the opportunity to respond the public consultation process for the Integrity Council for the Voluntary Carbon Market's ("IC-VCM") Core Carbon Principles ("CCPs"), Assessment Framework ("AF") and Assessment Procedure ("AP") and appreciates the IC-VCM's efforts to bring consistency to, and enhanced confidence in, this market.                                                                                                                                                                                                                                                                                                                                                             |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | As a global investment bank that provides carbon markets advisory to public and private clients, XXX views integrity as a precondition for a transparent, standardized, liquid and scalable VCM that efficiently channels capital into greenhouse gas ("GHG") reduction and removal activities. We view the IC-VCM's work as having the potential to accelerate investment and, in so doing, contribute to achieving the Paris Agreement goals.                                                                                                                                                                                                                                                                |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | Voluntary carbon offsets are currently being issued by a number of reputable parties (Verra, American Carbon Registry, Gold Standard, Climate Action Reserve etc.) in a manner that is credible and largely characterized by integrity. However, the diversity of standards, protocols, technologies, and approach to vintages limits consistency and creates confusion among buyers of offsets. Accordingly, there is a strong desire for the development of a benchmark that will help to eliminate some of the uncertainty that currently exists and facilitate ongoing improvement. XXX believes that the IC-VCM, acting as a governing body on the CCP, AF, and AP, has the potential and opportunity to: |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | 1. Improve consistency and comparability within and across disparate standards, and develop robust, best-in-class practices. Effective and harmonized governance of offset and inset standards will be essential for the success of the VCM and the converging compliance carbon market as a key lever to help mitigate climate change in a manner that is fair and equitable for suppliers, and affordable for end-users as they transition to net zero; and                                                                                                                                                                                                                                                  |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | 2. Reduce uncertainty for corporate offset and inset buyers through transparent and global threshold quality criteria that will reduce transactional friction and the transaction costs for all market participants, and thereby create scale and greater liquidity in the global carbon markets.                                                                                                                                                                                                                                                                                                                                                                                                              |

Commercial and Operational Viability                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | As it currently stands, the IC-VCM Framework risks sacrificing the scaling and the pragmatic growth of the VCM in order to pursue the highest-quality criteria set out in the CPP and AF/AP. In order to be "CCP-compliant", a carbon offset would need to meet very stringent and costly criteria that we do not view as commercially or operationally feasible in the short term. In particular:                                                                                                                                                                                                                                                                                                             |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | · The criteria must reflect current practice and cannot be set as aspirational targets with the effect of precluding most emission reduction and removal projects that give rise to credible, integrity-based offsets and insets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | · The monitoring and governance systems required to implement the CCP and AF criteria would demand considerable human resources and capital investments that could inhibit otherwise high-quality credits from entering the market.                                                                                                                                                                                                                                                                                                                    |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | · Based on our knowledge of the market, we believe that only a small number of carbon credit programs would qualify under the CCP criteria as drafted, thus reducing the flow of funds to otherwise good offset projects. For example, the proposed approach to the CCPs and the AF may preclude a number of carbon sink projects, for example, that are necessary to facilitate good offset projects and preserve and enhance carbon sinks in accordance with the goals of the Paris Agreement.                                                       |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | XXX urges the IC-VCM to create an initial threshold standard based on current best practice in the market and facilitate continuous improvement by building on existing assessments by ICROA and CORSIA, that can be promptly applied and achieved by well-established programs. This could eventually be followed by a process that will expand the requirements over time backed by science and the experience gained with the practical application of the threshold standard.                                                                      |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | 3. Learning From Precedent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | XXX observes that there is significant precedent within the broader carbon market for the creation of high-integrity offsets, specifically those from compliance carbon markets. Alberta, for example, has had a carbon offset program in place since 2007, while offsets within California's cap-and-trade market have been generated since 2013. These offset programs and associated offsets, while falling within compliance markets, bear the hallmarks of high-integrity offsets, including additionality, verification, registry tracking, etc. |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | We believe that the program regulators, overseeing existing compliance carbon offset programs, could bring enormous value, expertise, and insight to the creation of the CCPs and what works and what doesn't. In our review of the materials from the IC-VCM, and in conversation with some regulators, we did not detect that there had been engagement with them to date.                                                                                                                                                                           |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | Incorporating the experiences of the compliance offset market would be more efficient, as it would lead to alignment between compliance and voluntary markets. Given the desire for high-integrity offsets that are increasingly standardized, this could be an important foundational step to the voluntary markets long-term growth and interoperability.                                                                                                                                                                                            |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | Section 7: Sustainable Development Impact & Safeguards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | Many offset projects, such as natural climate solutions, can provide benefits beyond GHG reductions. At the same time, co-benefits can create additional confusion and complexity around the measurement or classification of project attributes that can be subjective. Additionally, requirements that track, monitor and verify these co-benefits can make the broader adoption of the CCP's more difficult for existing standards and market participants.                                                                                         |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | Section 8: Additionality                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | XXX urges the Integrity Council to consider performance baselines / benchmarks as a measure to assess additionality. Given that performance benchmarks allow for a single baseline to apply to multiple projects using the same technology or implementing a similar activity in a specific geography, this approach streamlines comparability and is viewed as a strong method to demonstrate additionality.                                                                                                                                          |
| 120 | Anonymous            | Figure 0.1 – Please answer yes or no | ge              | 0                 | As mentioned above, we strongly recommend the IC-VCM to build on what is being currently implemented across other programs (e.g., Alberta, Canada) and look at functional equivalency to their prescriptive requirements.                                                                                                                                                                                                                                                                                                                              |

One of the many points of feedback that XXX receives from clients is the voluntary offset market can seem daunting due to the heterogeneity of it – different standards, protocols, geographies, co-benefits, etc. Replacing a temporary credit with a permanent credit at a later date also adds to the confusion around double counting, where two credits (the temporary one and permanent one) represent the same tonne of emissions reduction. Temporary credits would create a significantly new element of confusion and risk, without providing material upside. They could potentially be deleterious to the integrity of the voluntary market, such as if the issuer of a temporary credit went under prior to providing a permanent credit, or if the temporary credit were replaced with another temporary credit. |

| 131 | Anonymous                                             | Foreword from Annette Nazareth       | te              | On the page before the Foreword, on the ICVCM mandate, for Point #2, "Provide governance and oversight over standard setting organizations on adherence to CCPs as well as on market infrastructure and participant eligibility". We do not think accreditation should be a role of the ICVCM, however ICVCM could act as an appeal body and final arbiter for any objections that are raised (in addition to being the standard setter). | Suggest changing Point 2 of the mandate to reflect our proposal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 134 | UKAS                                       | Foreword from Annette Nazareth | ge              | · A framework of oversight and assessment of these schemes and the bodies delivering the assessments against specified requirements, with a focus on competence, impartiality and independence.                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 134 | UKAS                                       | Foreword from Annette Nazareth | ge              | UKAS considers that structures developed for the voluntary carbon market must be internationally focused, recognising the global nature of the challenge facing us. International buy-in is crucial for success in this regard.                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 134 | UKAS                                       | Foreword from Annette Nazareth | ge              | In creating global solutions, and to maximise the trust and confidence that can be delivered in this area, UKAS recommends that ICVCM looks to existing global frameworks. These frameworks can and should be an important part of delivering the outcomes identified by ICVCM for the voluntary carbon market.                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 134 | UKAS                                       | Foreword from Annette Nazareth | ge              | We note that there were comments from participants during the online consultation events, held in the week 12-16 September, that referred to and acknowledged the importance of adherence to existing frameworks for quality, conformity assessment and for supporting regulation, namely ISO and IEC for standards and IAF, the International Accreditation Forum, for accreditation.                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 134 | UKAS                                       | Foreword from Annette Nazareth | ge              | The global framework of quality infrastructure is based upon the development of globally accepted standards of good practice for businesses and the mutual recognition of accreditation. This quality infrastructure benefits from the appointment by national governments of the participating institutions in each state.                                                                                                                                                                                                                                                                                                     | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 134 | UKAS                                       | Foreword from Annette Nazareth | ge              | UKAS therefore recommends that ICVCM sets as a priority the opening of a dialogue with IAF. IAF has a working group looking at sustainability issues, with one of its tasks being to consider how accreditation can support the voluntary carbon market. UKAS would be delighted to support this conversation. UKAS’s Chief Executive, Matt Gantley, co-convenes this IAF working group and is hence ideally placed to assist ICVCM.                                                                                                                                                                                            | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 135 | Anonymous                                  | Foreword from Annette Nazareth | ge              | Our organization, a leading carbon credit project developer, broker and solutions provider, appreciates the opportunity to comment to the public consultation on the IC-VCM’s Core Carbon Principles (CCPs), Assessment Framework (AF) and Assessment Procedure (AP), and supports the idea of a high-level governance body for the VCM that can support high-quality carbon credits.                                                                                                                                                                                                                                           | IC-VCM should rethink the entire approach proposed. The focus should be on principles and governance (similar to the approach of ICAO’s CORSIA) and should not get into detailed methodological approaches. Through proper governance and engagement in standards’ procedures, it would be unnecessary to go to the level of sector- or methodological- level review, which will be incredibly onerous, likely to be inappropriate for the very specific sectors, countries and activities included the (dozens, if not hundreds of available and under development methodologies), and quickly out of date. IC-VCM is off course and in it’s current approach will hinder th emarket significantly.                                      |
| 135 | Anonymous                                  | Foreword from Annette Nazareth | ge              | However, as currently written, we are incredibly concerned that the IC-VCM will not succeed in its mandate to ensure high quality, to offer a recognizable label that gives confidence to buyers, nor to scale the VCM. As currently written, the CCPs would undermine quality in several areas (particularly additionality and permanence), would be unachievable by any existing carbon standard (not due to a lack of quality, but due to the unreasonable and unworkable Assessment Framework), and would be incredibly time consuming and difficult to implement, likely becoming a major roadblock to scaling the market. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 135 | Anonymous                                  | Foreword from Annette Nazareth | ge              | This will erode trust in voluntary carbon markets, thereby slowing down rather than accelerating climate finance. More credence needs to be given to existing standards and assessments.                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 135 | Anonymous                                  | Foreword from Annette Nazareth | ge              | Assessing every credit type will be a slow process that has the potential to significantly hamper the market. We recommend a shift towards focussing on the crediting programmes and embedded best practice.                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 136 | Individual/employee, Dorr Asset Management | Foreword from Annette Nazareth | ge              | Dorr Asset Management is a leading trader and market maker in environmental markets including volunatry carbon offsets as well as regulated carbon allowance markets trading across spot and derivatives markets.                                                                                                                                                                                                                                                                                                                                                                                                               | All markets depend on integrity on ICVCM’s focus on deliver integrity to voluntary carbon offset markets is commendable. However, that said the approach is cumbersome and misses a far more important broader understanding of volunatry envrionmental markets which encompass biodiversity credits, renewable energy certificates, sustainable fuels, etc.A narrow and urgent focus on carbon is already creating distorted outcomes in markets and projects. We deeply encourage the industry to take a step back and realize that the base of markets involving nature require building conservation and restoration of biodiversity first, clean, sustainable and renewable energy second, and emissions as the last building block. |

| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | The system to submit responses to the public consultation is very laborious and, frankly, rather user-unfriendly. To make sure our points get through properly and we haven't accidentally pasted them in the wrong box, I have pasted our integral response (on behalf of XXX) here. Please process our response anonymously .                                                                                                                                                                                                                                                                                                                                                                                                          | -               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Thank you very much for the opportunity to react on the draft Core Carbon Principles (CCPs), Assessment framework and Assessment procedure. We are also very grateful to the board of the Integrity Council for the Voluntary Carbon Market for your enormous efforts to help scale the voluntary carbon markets.                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | In this response on behalf of XXX, we first share some general observations and then make some detailed comments per section (1 to 6). Our general observations have to do with sometimes overshooting in terms of theoretical quality criteria, towards a set of more workable CCPs and procedures and with the need for a set of CCPs that also fit nature-based solutions.                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | We did not seek to cover all of our questions and comments. There are more legal questions and comments, but rather than listing these at this stage, we think it would be more efficient if we (particularly our Legal Department) could raise these in a (possibly general) Q&A session.                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | General observations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Bringing back balance to a set of more workable CCPs and procedures                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Will the draft CCPs, assessment framework and procedure help to accelerate the scaling of the voluntary carbon market? In doing so, the ICVCM must balance on a thin rope. It is a balance with on the one hand maximizing quality requirements to ensure support from as many environmental and scientific groups as possible and on the other hand generating a set of workable and implementable principles that are not too detailed (principle versus rules based). We think the current documents may be a little bit out of balance to the first part: maximizing quality requirements. It might be better to further optimize the quality of requirements.                                                                       | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | The intention is growth of the voluntary carbon credit market without compromising on integrity. However, we believe the costs related to maintain a certain level of integrity may negatively impact growth of the market: if administrative costs, research, data gathering etc. ('production costs') rise, pricing of voluntary carbon credits in the market will also rise. We flag two possible results of high costs: carbon crediting programs may cut in the revenues to Partners in order to cover costs, and buyers may buy smaller amounts of voluntary carbon credits when the pricing is too high (possibly resulting in stagnating market growth). So here we flag a tension between 'integrity', market growth and costs. | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Of course, not to disrespect the importance of high quality but to give requirements more practical meaning, so that the roll-out of carbon project and its funding can actually speed up. Now, the requirements may be so detailed and so far removed from today's practice that they may even hamper scaling up. Of course, high quality is very important but if building an ideal world keeps us from taking steps in the real world, then we need to lower the bar a little. Let the ideal not stand in the way of a better world. Or in the words of Montesquieu 'Le mieux est l'ennemi mortel du bien' ('the best is the mortal enemy of the good').                                                                              | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Some observation to further explain what we mean with the above general observation:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 1) The documents, particularly Part 4, are very extensive and it will take very substantial efforts, time and costs to deal with all requirements, including updates. Hopefully this does not become prohibitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 2) In order to lighten the burden, reduce costs and to achieve more consistency across programs, it could be considered to develop templates (possibly differentiated per type of mitigation activity), containing standard language to cope with -inter alia- the requirement to have certain procedures, requirements etc in place. These could be included in the program "by reference".                                                                                                                                                                                                                                                                                                                                             | 0               |

| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 3) It is positive that ICVCM states that a "risk based approach" is taken. However, when going through the documents there are many mandatory requirements and there seems little room to deviate based on substantiated non-applicability or immateriality. This particularly applies to Section 7 of Part 4: Sustainable Development Impacts and Safeguards. This also applies to table 36 – Requirements for Criterion 7.11: Access and benefit sharing. One could imagine that a more risk based approach would be applied and this only applies in case of "sensitive" circumstances. Programs with large farmers for example should not fall within this scope.                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 4) Part 4, Section 3: Robust Independent Third-Party Validation and Verification. It seems that the CCP requirements sets rules for the engagement and instructions of the VVB, whilst it can be expected that the VVB itself deals with the topics referred to and will determine the requirements. There seems a risk of overlap and inefficiency. Accredited VVBs should incorporate relevant CCP rules in their protocols, so this risk will be mitigated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 5) Unsolicited assessments of programs: if ICVCM becomes the market standard, it is doubtful whether that has a real added value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 6) It is quite remarkable that there is no language dealing with the validity/tenor of carbon credits. Would it be a good idea to have old credits floating around while standards have substantially moved upwards? Would retirement within a certain time frame (possibly dependent on the quality of the credit) not be logical?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Towards a set of CCPs that also fit nature-based solutions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | We would recommend building more flexibility into the CCPs and procedures to also give space to carbon solutions that are still under development but have huge potential to reduce climate change. The current set of CCPs and the procedures seem to be drafted based on proven technology based solutions and planting trees/forests and REDD+ projects. Carbon farming seems to be out of scope in this draft. To show that (scaling up) our projects are therefore not helped by the drafts at hand, we provide an explanation of the XXX below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | The XXX is part of the XXX, that was founded in 1895 as a cooperative bank by farmers. Today XXX is the largest global food & agricultural bank. This explains why the XXX is primarily focused on accelerating sustainable food production with initiatives that reduce and remove carbon emissions from the atmosphere. We see the impact that climate change has on our clients and we feel the urgency to make a system change happen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | We have looked at your public consultation documents from this perspective of the need of providing high-quality carbon solutions resulting in enhanced soil health and nutritional value focused on improving sustainability for agri-food supply chains. We see carbon credits just a means. The ultimate goal of XXX is to have more sustainable agriculture. Carbon credits can help in the transition because they put a price on the ecosystem services delivered by farmers and by doing so giving them an extra income to make the transition to sustainable food production.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Let me be clear: prevention and reduction would be the preferred strategy for every corporate. Unfortunately, in everyday practice, not all emissions can be reduced to zero. For the emissions that are not yet avoidable, offsetting with high quality removal credits is a good option. If we were to wait until all emissions could be reduced, we would lose valuable time. We cannot afford that when it comes to fighting climate change! Furthermore nature based carbon credits are about more than removal. What makes carbon farming so powerful is that it not only removes GHG from the atmosphere, but also reduces emissions into the atmosphere. By using regenerative farming practices soil will be healthier because the biodiversity is improved and is then able to absorb more carbon. That will have co-benefits in terms of more water resilience, reducing pollution by minimizing erosion and nutrient runoff, purifying surface and groundwater, increasing nutritious value of crops, and possibly enhancing crop production. | 0               |

|-----|----------------------|--------------------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Although soil sequestration has many co-benefits, it may not fulfill the CCP-requirement of permanence defined in a strict way. This may therefore be an impediment to scaling the nature based carbon credits market. We propose to take a broader view and also include the co-benefits and a more pragmatic definition of permanence depending on the (im)possibilities of the project (including co-benefits). Permanence may become better feasible when a reward system for keeping carbon stored in soils is developed next to the reward system based on carbon credits for storing extra carbon. Rewarding farmers that are already following the regenerative agriculture pathway and developing a sustainable agriculture will help prevent carbon losses and maintaining current carbon stocks. That is just as important as the influx of extra carbon in soils. | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Besides permanence more flexibility is also required when it comes to additionality, and allow closer cooperation between private and public parties on carbon farming, without jeopardising the additionality of the credits. Governments investing in carbon farming projects make it difficult for private parties to guarantee additionality, which is necessary to realise high integrity credit on the voluntary carbon market. Governments that invest in soil sequestration out of good intentions might then discourage the private sector from also investing in soil sequestration. It is important to enable private-public co-investment instead of crowding out private initiative.                                                                                                                                                                             | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Also it is unclear why there is more flexibility created for additionality of tropical forest protection, or JREDD, and not for other nature based carbon solutions (part 1, p. 14)?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |

Please expand the definitions section with frequently used terms (program, carbon-crediting program, project, mitigation activity proponent, user, etc.) and any abbreviations used in the text (IPLC, SDG, ICP, NDCs, etc) to increase legibility.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Stakeholders. For clarity purposes, please also provide a list of all parties/stakeholders involved in the voluntary carbon credit market and their (separate or combined) roles under the Framework. This to clarify that different roles may be in one party or in different parties. As we understand it a mitigation activity proponent, a carbon-crediting program, the program registry and even a user, can be, but not necessarily have to be, within one and the same entity. These can be separate entities.                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Vintage credits. Do vintage credits follow the CCP-eligibility status of the program with retro-active force? Please make (more) explicit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Introduction (p. 15): "Once a carbon-crediting program and a particular credit type has been approved, the carbon-crediting program will then identify and tag the relevant carbon credits in its registry."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | How is 'interoperability' maintained? Will there be a standard with everyone doing this in the same manner, will there be a prescribed format?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |

| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | One of the CCPs is 'no double counting'. What is ICVCM's position on double claiming (or double usage) when reducing scope 3 emissions? If there is a reduction on the land of a farmer who is in the value chain of several food corporates, then these food corporates can all claim that their scope 3 has decreased. Is that possible under this CCP?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Authorisation for Article 6 purposes and 4. Adaptation co-benefits. The interaction with the Paris Agreement is still work in progress, we understand. Currently it is not very clear how that is supposed to work. The potential double counting issue remains present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Detailed observations XXX Part 3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |

| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Question ICVCM: Are there other key considerations that should be explored?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | We could imagine that the accounting side would be of relevance. But as this is on the buyers side, it may make sense to leave this out of scope.                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | A. Program Governance: To ensure that carbon credits are issued to the correct entity and follow a clear chain of custody, the carbon-crediting program must have appropriate processes in place. Programs should also have liability provisions in the event of erroneous issuance of credits by specifying the party responsible for cancelling the credits or compensating the over issuance.                                                                                                                                                                                     | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Would make sense in our view to align this and other legal issues in accordance with International Swaps and Derivatives Association (ISDA).                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Sub B: "A rigorous accreditation process complemented by measures to limit potential conflicts of interest such as rotation of VVBs to limit review by a VVB of its own work helps to ensure impartiality" This seems a rather cumbersome and costly process, is it a voluntary requirement (for now)? Or will it be(come) mandatory in time? After how many years would one need to switch VVBs?                                                                                                                                                                                    | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Sub B: "Under the full threshold of the draft Assessment Framework, oversight procedures by programs include requirements to assess VVBs in performing their auditing functions, including reviewing individual VVB reports, systematic monitoring and having a system for sanctioning non-conformity." Who should audit the auditor? Also see part 4, criterion 3.5 – isn't this too much accumulation of regulation?                                                                                                                                                               | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | D. Registry: In order to ensure that accounts are created in the registry by rightful account representatives, carbon-crediting programs must have robust know your customer processes for account opening, including checks on identity and credentials of account representatives.                                                                                                                                                                                                                                                                                                 | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Justified, but this may turn out to be quite an issue, if you compare this to how banks are struggling with this. Please take a better look at what KYC regulation would mean for in terms of benefits but also costs.                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Sub F: "Carbon-crediting programs play an important role in ensuring that mitigation activities identify, assess and disclose the potential risk of environmental, economic and social harm and implement actions to avoid or minimise them while delivering net positive impacts beyond its GHG contribution." à Should the focus not be on offsetting GHG contribution while at the same time 'do no harm' during implementation of the mitigation efforts? To expect to also be delivering net positive impacts beyond the GHG contribution seems like a bridge to far (for now). | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Sub G: Additionality. If a credit is regulated it is no longer additional. But when does the CCP consider a credit regulated, is this the case with ETS credits, mitigation activities required and regulated by law, or also in case of local policies or recommended and/or subsidized mitigation activities? (or for instance: under the Carbon Farming initiative the EU is proposing to implement).                                                                                                                                                                             | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Sub G: What is the effect when a non-regulated mitigation activity now falling under CCP-eligibility, becomes a regulated activity? It can no longer be CCP-eligible. Is this a 'material change' under 2.3.1/3.4.2? When will the CCP-eligibility terminate, immediately or with some delay?                                                                                                                                                                                                                                                                                        | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | sub H: Permanence. Not for all credit-types a full permanence is possible, and a system of full compensation for any reversals may be equally impossible if not for practical reasons – limited and timebound supply – alone. When talking about compensation in case of unavoidable reversals, does the ICVCM intend an 'in full' compensation or an 'in part' compensation? The compensation mechanism has a lot of loose ends.                                                                                                                                                    | 0               |

| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | If 'in full', how does the ICVCM foresee that market participants tackle the issue of 'full' compensation? Both in the situation where the carbon-crediting programs, mitigation activity proponents, etc. is the seller and in the situation where carbon-crediting programs, mitigation activity proponents, etc. is acting as an intermediary for the third party 'creators' of the credits, for instance smallholder farmers or IPLC's? Where would the responsibility for this full compensation lie and how can it be done without causing practical or financial difficulties for these parties that – as the ICVCM points out – are already struggling? This would apply to both in kind compensation (replacement credits) as to financial compensation. Full compensation may even mean a business risk for larger companies, it may for instance tie-up capital in long-term financial provisions and/or be a continued financial risk. | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Would a sharing of risk for unavoidable reversals on both parties (seller/ buyer) with a pre-agreed limitation on compensation and time for compensation not be more economically viable?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |

| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Our general remark that the requirements may be so detailed and so far removed from today's practice that they may even hamper scaling up apply especially to all of the many and very detailed requirements in part 4. Each detail may be considered valid if you assess them in isolation, but added all together it is probably too much. Also not all of these requirements are equally relevant. Would it be possible to have a stricter prioritization on what is need to have and what is nice to have? For smaller and midsize projects that do not have large organisations behind them and have less money to spend, eligibility with the CCPs thus does not come within their reach. This does not contribute to the inclusiveness ICVCM is striving for.                                                                                                                                                                               | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Table 2: legal underpinnings of carbon credits, including custody and liability provisions and Table 8; as mentioned before, alignment with ISDA on legal and documentary matters is advisable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Table 6: Public Engagement in decision making seems to go very far for rather standard programs and seems complex/time consuming.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Table 4 (a): It shall not receive any form of funding which could imply undue influence of competing interests. This will need to specified further as to allow for providers of funding (banks or investors) to finance/transact in accordance with laws and regulations to avoid conflicts of interest, such as 'Chinese Walls'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Table 9: Effective corporate governance; this comes across as heavy for rather standard programs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Criterion 8.6 c) sub c): "c) The mitigation activity shall not be deemed additional if the market penetration surpasses a threshold higher than [5%][X%]." - We may not understand this correctly, this section 8.6 is somewhat difficult to follow, but does this text mean that if there is a market uptake of a mitigation measure and it becomes common place that this might affect CCP-eligibility of this particular program/ credit? This seems to be the case, but "market penetration" should be defined clearer (which market)?                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Table 41, under Full, option 2: this text is not clear in its intention (why an option 2 if that states that option 1 already suffices?). The reference to a) and b) above seems to be incorrect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Table 44: is the proposed length of commitment to monitor etc realistic, recognising that option 3 provides an alternative?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Criterion 9.3: Temporary crediting approaches: is this really useful?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Criterion 10.2 In the second phase of the Integrity Council, the following aspects shall also be assessed for carbon credits authorised for Article 6 purposes: [..]. I can understand where they are coming from, but this seems quite ambitious.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |

| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | If carbon credits are being qualified as tradeable financial instruments banks that are involved in carbon solutions will be seriously impacted, because financial instruments are heavily regulated. Is it really a financial instrument as meant in financial regulations?                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Detailed observations XXX Part 6                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 2 general question: "Should the Integrity Council reserve the right by exception to assess programs unsolicited, at its own discretion, based on publicly available information?"                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Will it be possible to do an adequate assessment of programs based on just public information? What if the program does not have the ambition to adhere to all the CCPs and is not making that statement either. Based on what mandate would the ICVCM then be allowed to check whether the program fulfils the CCPs?                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | When a program does indeed claim it fulfils the CCPs then ICVCM could contact the program owners and start an assessment procedure to check the claim. An adversarial procedure should then be in place to guarantee a fair hearing.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 2 & 3, in general:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | We note that based on the mentioned activities of the ICVCM, Governing Board and Secretariat the workload of these parties may be considerable and lead to possible capacity problems and delays. Timelines for applicants/ carbon crediting programs are set, however timelines for ICVCM, etc. are usually 'intended timelines' or no timelines are provided. How will reasonable timelines be guaranteed? Specifically in instances of 2.3.4, 2.3.5., 3.4.4. and 3.4.5. (of which we argue the timelines for publication 'within 2 days' are rather short and no timeline for publishing the lifting of suspension is given) and 6.3.2 & 6.4.2 - responding to a complaint/ appeal ('will aim') | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Please make more explicit in the clauses regarding suspension and termination there will be a right for the program, at its request, to plead its case and provide rebuttal to any preliminary assessments by the ICVCM, this is now not explicitly mentioned.                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Monitoring by the ICVCM: how is this done? Could you please explain this in more detail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 2.1.5: We argue that whatever the program qualifies or explicitly marks as confidential should be treated as confidential – regardless of there being a compelling rationale for confidentiality (as agreed between program and ICVCM).                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 2.2.2: "The Integrity Council will process complete applications in the order in which they are confirmed as complete. It may initiate an assessment at its own discretion at any time." What does the underlined sentence mean with regard to the preceding sentence? It now reads somewhat as if applications will be treated in order of arrival unless the ICVCM decides otherwise.                                                                                                                                                                                                                                                                                                            | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 2.3.2: at several places in this framework there is a reference to the ICVCM monitoring based on data – what data is referred to here and where does the ICVCM get this data? For instance also 3.1: assessment of credit-types that have not yet applied – how, based on what data?                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | Regarding the question under 2.2.6: granting (possible) temporary CCP-approved status may cause issues with financing, including securities for financing, and sale of these temporarily approved credits (it may be revoked, buyers may prefer fully approved).                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 137 | Anonymous            | Foreword from Annette Nazareth | ge              | 2.3.4: Notable is that the ICVCM can revoke CCP eligibility of a program or credit in exceptional circumstances. Please note that this creates a risk (also for financing).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |

| 138 | Anonymous            | Foreword from Annette Nazareth | ge              | XXX welcomes the IC-VCM initiative to drive high quality carbon offsets in voluntary carbon markets. Global standards are crucial to providing stakeholders and the public with confidence that the use of carbon offsets strengthens global climate action.                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 138 | Anonymous            | Foreword from Annette Nazareth | ge              | For carbon offsets [MM1] [BH2] to realize their full potential to contribute to stabilizing global emissions, voluntary carbon market standards should combine rigorous requirements for quality and transparency with participation criteria to enable participation from as wide a range of sectors as possible.                                                                                                                                                                                                                                                                                                                                                                                 | 0               |

| 138 | Anonymous            | Foreword from Annette Nazareth | ge              | The high-quality carbon offsets [MM3] must not only deliver real additional emissions reductions/removals but also provide environmental and social benefits going beyond the do-no-harm principle.                                                                                                                                                                                                                                                                                                           | 0                                     |
| 138 | Anonymous            | Foreword from Annette Nazareth | ge              | · We support the intention behind the IC-VCM, however are concerned that the 'one size fits all' approach – and additionally, in many cases, too detailed and prescriptive requirements – does not significantly consider the differences in local conditions, which may be detrimental to development of project-based solutions.                                                                                                                                                                            | 0                                     |
| 138 | Anonymous            | Foreword from Annette Nazareth | ge              | Our view is that the Assessment Framework should focus on assessing crediting programs and provide guidance for VVBs for validating projects. It is important that VVBs have knowledge and competence with regards to projects in question and corresponding methodologies. To ensure that we recommend that there is a pre-approval and certification process for VVBs to promote credibility and transparency, resources and competence related to the function 3rd party verification is utmost important. | 0                                     |
| 138 | Anonymous            | Foreword from Annette Nazareth | ge              | We believe it is important that the global threshold that IC-VCM tries to put in place sets a bar for the quality of credits. We would therefore welcome an impact assessment from the IC-VCM on the gap between common best practice today and the proposed criteria and requirements. The CCPs should be based on the current best practice focusing on material criteria, introducing additional requirements in a gradual and pragmatic way.                                                              | 0                                     |
| 138 | Anonymous            | Foreword from Annette Nazareth | ge              | We also note that a lack of clarity whether CCP standard will be imposed retroactively or for projects that are already sanctioned. That may potentially have significant implications and needs to be clarified. We recommend that once published, the CCP criteria and requirements will be applied for new projects .                                                                                                                                                                                      | 0                                     |
| 139 | Anonymous            | Foreword from Annette Nazareth | ed              | Displacement of local populations / land deprivation                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Please post this comment anonymously. |
| 139 | Anonymous            | Foreword from Annette Nazareth | ed              | · The Assessment framework allows for a CCP-labelled mitigation activity to cause physical and economic displacement, provided it is “unavoidable” and “with the consent of affected parties”.                                                                                                                                                                                                                                                                                                                | 0                                     |
| 139 | Anonymous            | Foreword from Annette Nazareth | ed              | · Given the difficulty of assessing consent to displacement, especially in underdeveloped countries with weak rule of law, this rule will prove controversial, and more safeguards should be implemented.                                                                                                                                                                                                                                                                                                     | 0                                     |
| 139 | Anonymous            | Foreword from Annette Nazareth | ed              | Double counting of carbon credits in host countries' NDCs                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0                                     |
| 139 | Anonymous            | Foreword from Annette Nazareth | ed              | · A carbon credit sold to a private entity is not necessarily written off the carbon accounting of the country hosting the project, a practice known as "double counting".                                                                                                                                                                                                                                                                                                                                    | 0                                     |
| 139 | Anonymous            | Foreword from Annette Nazareth | ed              | · The existing standards have opposing stances on the issues (see this memo from the CoEI on the issue).                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                     |
| 139 | Anonymous            | Foreword from Annette Nazareth | ed              | · It is regrettable that the ICVCM does not take a stance on the issue, especially as it seems linked to the recent export bans of carbon credits (in India, among others), which risks stifling growth of the VCM.                                                                                                                                                                                                                                                                                           | 0                                     |

| 139 | Anonymous                          | Foreword from Annette Nazareth | ed              | · It would be welcomed to have more clarity on the timeline and whether further public consultations will be conducted on the (numerous) next steps of the ICVCM's work: assessment of credit types; list of "lock-in" activities; development of SDG+ tags/labels; stance on double counting of credits in NDCs...                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                       |
| 140 | Anonymous                          | Foreword from Annette Nazareth | ge              | In the end it's very important to make the voluntary carbon market as easy and simple as possible for everybody involved. So this work done now is very important to make the market work well. The mitigation impact is the most important.                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The application of CCP should be general and everyday practise. When reading these documents, it's easy to get lost. So hoping that in the end the application would be as easy to use as possible! And the information and communication about this subject would become as understandable as possible. Thank you for the work by now. |

| 142 | Sadie Frank                        | Foreword from Annette Nazareth | ge              | CarbonPlan is a nonprofit research organization dedicated to improving the transparency and scientific integrity of carbon removal and climate solutions. We thank the Integrity Council for the Voluntary Carbon Market (IC-VCM) for the opportunity to provide feedback on the draft Core Carbon Principles (CCPs).                                                                                                                                                                                                                                                                                                                                                                                | See our comment.                                                                                                                                                                                                                                                                                                                        |
| 142 | Sadie Frank                        | Foreword from Annette Nazareth | ge              | Current carbon market standards are at a crossroads. If carbon credits are to play a responsible role in global decarbonization — and therefore one that is appropriately limited — they must deliver robust, rigorously assessed climate benefits. Today they do not.                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                                                                                                       |
| 142 | Sadie Frank                        | Foreword from Annette Nazareth | ge              | We were encouraged to see the IC-VCM draft Core Carbon Principles which we believe would push the industry to close the gap between promise and practice. We see the Integrity Council's proposal as a fundamentally modest, incremental approach to improving market outcomes — one that will take significant work to implement fairly and effectively, but work that is needed one way or another.                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                       |
| 142 | Sadie Frank                        | Foreword from Annette Nazareth | ge              | In preparation for the consultation, we had hoped to discuss how to make the additionality analysis more robust to avoid the mistakes of the earlier CDM offsets program from which it borrows its screening techniques. And we had hoped to emphasize how important it is that offset programs claiming to achieve a minimum durability of 50 or 100 years demonstrate actuarially sound analysis that accounts for physical reversal and bankruptcy risks, rather than the vague hand-waving common in today's markets. On both of these critical issues, the reasonable progress implied by the proposed standards could be achieved or lost depending on nuanced choices made on implementation. | 0                                                                                                                                                                                                                                                                                                                                       |

| 142 | Sadie Frank          | Foreword from Annette Nazareth | ge              | But it is clear to us that the offset industry has no appetite for strengthening the proposed CCPs, which would require incumbents to change their tune. The reaction from some registries could not be more clear: they are fundamentally opposed to making real change. The momentum in favor of the status quo is enormous, as is the pressure on the Integrity Council to weaken the current proposal. We don't think the draft proposal goes far enough along key dimensions of quality, but we also recognize that the foundations of this broader enterprise are being called into question at the last minute — a recognition that has informed our responses in several questions, where the atmosphere demands a higher bar than what has been proposed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 142 | Sadie Frank          | Foreword from Annette Nazareth | ge              | We think the Integrity Council should maintain its independence to focus on new market entrants and others committed to a reform trajectory, but we also recognize that this could mean losing the support and potentially participation of the dominant registries today. Keeping that support likely requires watering down standards to superficial improvements to the status quo. While that would surely please incumbents, it will do nothing to address the quality problems in today's carbon credits markets. Such a move will also visibly undermine any case the offset industry has made worldwide that it can self-organize in support of better quality through the Integrity Council — including before regulators considering legally binding requirements at the US Commodity Futures Trading Commission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 142 | Sadie Frank          | Foreword from Annette Nazareth | ge              | So we appreciate that the Integrity Council faces a much more difficult challenge than we do in responding to this consultation. Either hold the line and tolerate the outcome of working to grow a minority of today's market, or capitulate and undermine the business case for confidence promised at the outset of this effort. We remain willing to support constructive efforts to recognize quality outcomes in the carbon markets, but worry that the politics supporting that possibility here are coming undone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 143 | Anonymous            | Foreword from Annette Nazareth | ge              | On behalf of the XXX, we commend the Integrity Council for Voluntary Carbon Market's (ICVCM) efforts to ensure the voluntary carbon market accelerates a just transition to 1.5°C. As a Coalition we have long been vocal about the need to increase carbon credit integrity and bring more guardrails to carbon markets. Several coalition partners have actively engaged with ICVCM since its inception, and we remain committed to supporting the institution's mission. It is clear much thought and deliberation has gone into the draft Core Carbon Principles (CCP) and Assessment Framework (AF). While we applaud ICVCM's efforts, the CCPs and AF have ultimately taken an approach to achieve the impossible: establish a prescriptive and universal threshold of credit integrity that is agnostic to credit type, geography and sector. While sensible from a purely academic perspective, these efforts fail to recognize the critical differences between carbon crediting programs which, by necessity, take differing approaches to addressing the principles identified by ICVCM based on project scope and type. It is akin to establishing a global safety standard for transportation, while failing to acknowledge that aviation and rail travel must take drastically different approaches to meet the shared goal of passenger safety. In practical terms, demonstrating additionality of avoided deforestation projects in the tropics is uniquely distinct from methodologies to demonstrate additionality for methane capture and destruction. And while a corporate Direct Air Capture developer can easily develop financial models to demonstrate the need for carbon credit revenues to meet a suitable internal rate of return on a \$100 million project, expecting smallholder farmers or ranchers to meet the same data and parameter requirements to demonstrate financial additionality for local-level agricultural management projects is impractical. Such divergences are also evident when evaluating mechanisms for ensuring permanence, where buffer pools based on actuarial analysis are relevant and suitable for nature-based approaches but inconsequential for technological approaches. The CCP and AF fail to reflect these important nuances, and instead apply a rigid global litmus test for all carbon crediting programs based on a long list of prescriptive and largely unworkable criterion. Ultimately the draft framework could have potentially devastating real-world implications. It would be years — if ever — before most carbon crediting programs could meet the thresholds established by the AF. Natural climate solutions programs are particularly disadvantaged by structural bias in the reporting, additionality, and permanence requirements making it nearly impossible for land-sector standards to meet these thresholds. Should ICVCM move forward without a drastic rethinking of the CCPs and AF, a very likely outcome would be a substantial reduction in capital flowing to projects which address land-sector emissions, putting our already perilous global climate goals further out of reach. We are at a | see above       |

| 144 | Peter Hurrell                           | Foreword from Annette Nazareth | ed              | A key point to understand about the voluntary carbon markets is that it is – as the name suggests – voluntary. It is driven by private sector actors, and is not regulated by governments or financial authorities. But unregulated should not mean fragmented or opaque, and it certainly should not limit the potential of the market to contribute as fully as possible to securing a liveable future for the planet and everyone on it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | While the market may be voluntary in name, the drive for ESG in financial markets essentially renders it obligatory for large corporations who require access to market capital for investment and for whom reputational damage presents an existential threat.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 144 | Peter Hurrell                           | Foreword from Annette Nazareth | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | It is also not strictly true that the sector is not regulated by governments or financial authorities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 144 | Peter Hurrell                           | Foreword from Annette Nazareth | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | As with any type of trade or investment, the activity is already regulated in common law. Typically in new markets, bad actors will abuse the system in order to break already existing laws for profit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 144 | Peter Hurrell                           | Foreword from Annette Nazareth | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | The abuse of the European Emissions Trading System in its infancy is a good example of this. The total cost of fraudulent activity was in the 100s of billions. The same was true with renewable energy and particularly wind farm subsidies which were actively pursued by international organised crime syndicates.                                                                                                                                                                                                                                                                                                                                                                |
| 144 | Peter Hurrell                           | Foreword from Annette Nazareth | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | It is our recommendation that we should assume that the voluntary offset market is going to be regulated as it scales much in the same way as has happened recently with the crypto market.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 144 | Peter Hurrell                           | Foreword from Annette Nazareth | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | We already know that this is happening in Europe with draft legislation already available for consultation in the rapidly growing technology based carbon removal sector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 144 | Peter Hurrell                           | Foreword from Annette Nazareth | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | It is also our recommendation that as an industry we should already now be adopting methods and practices similar to those already implemented in financial and energy markets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 144 | Peter Hurrell                           | Foreword from Annette Nazareth | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 1. When governments and financial authorities begin their scrutiny of the industry they will recognise how it functions and will be able to easily integrate it into their existing regulatory frameworks thereby minimising market impact.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 144 | Peter Hurrell                           | Foreword from Annette Nazareth | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 2. There is no need to reinvent the wheel. Self-regulating to the same reporting and transparency standards as financial and energy markets together with an analogous approach to the standardisation of information exchange and communication protocols can be a relatively straightforward task with minimal cost and effort as the heavy lifting was already done by those sectors. How transactions are described, their meaning, standard counterparty and entity ID's (e.g LEIs), KYC and AML practices are all good examples of methods and processes that can simply be plugged directly into new business models emerging in the carbon removal and sequestration sector. |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | Standard Chartered ('the Bank') supports the Integrity Council for the Voluntary Carbon Market's ('Integrity Council') initiative and we welcome the opportunity to comment on the draft Core Carbon Principles (CCPs), Assessment Framework (AF) and Assessment Procedure. The Bank believes that it is crucial to set a global threshold standard to build trust in the market and to establish a benchmark to identify credible and accessible high-quality carbon credits that will help scale up private climate finance towards the Paris Agreement goals. On demand-side integrity, the Voluntary Carbon Markets Integrity Initiative's ('VCMII') proposed Code of Practice will encourage companies to deliver beyond their climate commitment. The collective efforts made by the Integrity Council and VCMII will be significant in giving steer to the market to address the USD95 trillion financing gap in emerging markets, where 90% of the natural climate solutions (NCA) potential sits. | (see above)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | Furthermore, the Integrity Council should acknowledge the work done by the standard setters over a number of years to establish robust and effective carbon crediting processes, which can be used as a basis for the high-quality threshold standard that the market needs today. More needs to be done to support continual improvement and allow comparison between those standards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | It has been a privilege to contribute to the work of the Integrity Council with our market expertise over the past two years. It is clear from previous feedback and engagement that consensus needs to be reached across the industry, especially on the Additionality and Permanence principles and how to treat project-based REDD+. As we are racing against the clock in achieving net zero carbon emissions by 2050 to keep 1.5°C alive, we advise finalising and publishing the CCPs and AF by January 2023 at the latest. Any further delay will fundamentally undermine credibility in the Integrity Council and the CCPs.                                                                                                                                                                                                                                                                                                                                                                        | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | In this response, we focus on areas of relevance to the Bank. We make the following key recommendations to enhance the draft CCPs assessment framework and procedure:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|-----|-----------------------------------------|--------------------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | 1. Develop a road map and clear goals. It is important to make clear to the market where the assessment framework stands and what can be achieved in its current state. A road map is needed to indicate how the current standards will be raised in the future. We suggest publishing a 2023 work plan by the time of the WEF meeting in Jan 2023, which would also indicate areas for further evaluation and follow up actions to enhance the CCPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | 2. Publish a baseline threshold of CCPs using CORSIA as a basis for governance. The Integrity Council should not be setting a new standard for carbon crediting. Instead, identifying best practices and baseline requirements at programme and standard level is critical. The Integrity Council should look to established industry bodies' standards to form the basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | a. We suggest using the Carbon Offsetting and Reduction Scheme for International Aviation ('CORSIA') as the starting baseline threshold that can be consistently applied across the industry. In addition, benchmarking standard setters and standardising how the project information is presented will help buyers when they purchase carbon credits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | b. The Integrity Council should then encourage all standard setters that want to be considered eligible for the CCPs to apply these principles to all their methodologies, with a standard approach agreed for key criteria such as additionality, permanence, and project-based REDD+ in all its forms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | c. The Integrity Council should have oversight of the carbon crediting programmes to independently check that these principles are being applied in full, and to assess the carbon programmes' methodologies and shortlist the types and locations that would be considered eligible for the CCPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | 3. The Additionality principle should not rely exclusively on financial additionality tests. Financial additionality can be challenging to apply in practice. Performance standards are the current best practice in the market and are already used in the Voluntary Carbon Markets to assess additionality across a project type. In addition to providing a robust additionality assessment that standardizes across project approaches, they also connect to the project baseline that standardises the credit quantification process.                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | 4. The Permanence principle requires a higher level of inclusivity. There are various approaches in the market that may or may not fit for specific activities and/or geographic locations. The Integrity Council should take a more high-level approach and establish a threshold standard that reflects market reality. There needs to be a realistic assessment of practicality and enhanced use of other approaches such as pooled buffer reserves, re-insurance, global remote sensing Measurement, Reporting, and Verification (MRV) systems development and other mitigation technologies. For instance, measurement and reliability of Natural Climate Solutions (NCS) can be improved by strengthening technological requirements in accessing MRV. Digitization can help streamline data collection and quality control in the MRV process, saving time and cost to carbon credit issuance. | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | 5. Sustainable Development Goal (SDG)-alignment should be considered for project attributes. SDG-alignment should be assessed against projects to signpost project activities to buyers. Separately, a system for nesting project-based REDD+ and supporting the development of Jurisdictional REDD will help mitigate climate change with natural solutions. Entrepreneurial activities in key areas are important for the growth of the market and the livelihood to local communities and indigenous groups.                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | 6. Establish buyer coalition to boost market confidence. Buyers are highly selective about the credits they buy, and many are cautious about which projects qualify. We suggest developing a buyer coalition that will commit to buying a certain amount of or to pay a certain price for the CCP-eligible credits. A buyer coalition will boost developers' confidence that there is market demand and that the process is worth supporting.                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | There is a need to recognise the urgency of publishing the CCPs and AF, despite various views across the industry. The way carbon credits are assessed will constantly evolve so the framework needs to reflect current market practices as much as possible. As we work together to reach consensus, we are confident that the feedback for this consultation will further enhance the effectiveness of the CCPs and AF and provide a clear direction to the market.                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 145 | Individual/employee, Standard Chartered | Foreword from Annette Nazareth | ge              | We would be pleased to discuss the content of our feedback. | 146 | Alexandre Grais                                | Foreword from Annette Nazareth | ge              | Revalue Nature is pleased to provide its input to the IC-VCM Consultation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | See above       |
| 146 | Alexandre Grais                                | Foreword from Annette Nazareth | ge              | Overall, we strongly support the IC-VCM's efforts to bring improved governance, higher transparency and integrity to the Voluntary Market. However, careful consideration is needed to ensure that such new requirements are able to incentivize the market with a clear and feasible timeline for the Standards and project developers to comply and implement. In particular, while the CCPs create requirements for Standards and specific methodologies, we would recommend the IC-VCM create an incentive/recognition for project developers who are willing to early adopt certain requirements within their control, e.g. complying with IFC Performance Standards, committing to highest level of transparency in the Project Design Document and additional audit on benefit/revenue sharing plans, financial flows from credits sales (which could also be required by certain investors).                                                                                                                                                                                                                                                                                                                                        | 0               |
| 147 | Individual/employee, Intercontinental Exchange | Foreword from Annette Nazareth | ge              | ICE appreciates the opportunity to comment on the public consultation on the draft Core Carbon Principles (CCPs), Assessment Framework and Assessment Procedure of the Integrity Council. We welcome the work of the Integrity Council and are supportive of its objective to establish widely applicable carbon principles that support standardisation and enhance the participation in carbon markets. We agree that by increasing trust in carbon credit markets, they can be more widely accepted to credibly contribute to net zero goals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | See above.      |
| 147 | Individual/employee, Intercontinental Exchange | Foreword from Annette Nazareth | ge              | We however think that some of the requirements of the assessment framework may unnecessarily deter crediting programmes from seeking a CCP assessment. In particular, the requirement for applicants to commit to complying with the full stringency threshold in a timely manner could discourage projects that currently could meet the CCPs from applying. Accordingly, ICE believes the best way to swiftly foster trust in the market is to start with a threshold that is achievable now by well-established, credible programmes. These standards can be changed over time as the market develops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 147 | Individual/employee, Intercontinental Exchange | Foreword from Annette Nazareth | ge              | The Integrity Council's envisaged role to not only act as standard setter, but also to provide assurance, to enforce standards, and to administer complaints and appeals procedures, is too ambitious. ICE cautions the Integrity Council to consider the costs associated with these responsibilities and, to the extent these costs are passed along to users of the assessment framework, it could disincentivize the use of these standards, especially when many carbon credit programs already have many layers of oversight and regulation (external and internal).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 147 | Individual/employee, Intercontinental Exchange | Foreword from Annette Nazareth | ge              | With a view to its limited resources, we also think the Integrity Council should avoid replicating the roles of well-established and reputable credit programmes. Rather than assessing project types on methodologies, additionality etc., the Integrity Council should rely on assessments in accordance with established standards and processes developed by existing credit programmes. Otherwise, we fear that by approving every project type and methodology, as well as the frequent updates that are under continual development, the Integrity Council will overburden itself and create unnecessary bottlenecks that could undermine market confidence. We thus suggest a focus on program-level, rather than project-level, assessments. Instead of issuing approvals for individual methodologies or groups of methodologies, the requirements and approval processes applied by programs should be assessed. Accordingly, whilst we appreciate the Integrity Council's ambitious framework, we suggest beginning with requirements that are realistic to achieve and a mandate that does not overstretch capacities. Otherwise, we fear the initiative will become unworkable for both applicants and the Integrity Council. | 0               |
| 148 | Anonymous                                      | Foreword from Annette Nazareth | ge              | In the absence of a place for overall comments, we provide our top-level feedback here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | N/a             |

| 148 | Anonymous            | Foreword from Annette Nazareth | ge              | We support the goals of the ICVCM and appreciate what has clearly been a vast amount of work to produce this draft. The voluntary carbon market must support decarbonization at scale as well as drive capital into the activities necessary to achieve a just transition. It should do so with a sense of appropriate urgency. This means that ICVCM's activities should:                                                                                                                                                                                                                                                               | 0                                                                                                                             |
| 148 | Anonymous            | Foreword from Annette Nazareth | ge              | 1. Support and acknowledge the work of high-quality programs, screen out low-quality programs, and enhance the scale and pace of the market.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                             |
| 148 | Anonymous            | Foreword from Annette Nazareth | ge              | 2. Be as efficient as possible and seek to eliminate the addition of middlemen and rent-seekers to the process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                             |
| 148 | Anonymous            | Foreword from Annette Nazareth | ge              | 3. Take a robust yet flexible approach, and not set a bar so high that no current standard can meet it (which would ultimately be detrimental to a high-quality, high-functioning market).                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                             |
| 148 | Anonymous            | Foreword from Annette Nazareth | ge              | The ICVCM core carbon principles and assessment framework, as currently written, accomplishes none of these goals. Instead, the ICVCM proposes to duplicate the work already done by registries. It sets a bar so high that none of the programs currently operating can meet it, nor do they have a pathway to doing so in the foreseeable future, despite the many years of rigorous multistakeholder work that has gone into them. This will create a perception that the entire carbon market is untrustworthy and will cut this critical investment off at the knees at a time when it is needed most. This is counterproductive.   | 0                                                                                                                             |
| 148 | Anonymous            | Foreword from Annette Nazareth | ge              | The ICVCM further needs to better recognize the unique benefits offered by NCS/NBS projects and ensure that they can remain a part of its proposed solution. The governing processes of many of the existing registries have undergone years of rigorous work to ensure robust, transparent, and high quality responses to many of the issues that have been offered by their critics. The ICVCM should be able to explain why it feels that existing requirements do not go far enough, and why its judgments should supercede those of the technical experts who have spent years developing high quality and auditable methodologies. | 0                                                                                                                             |
| 148 | Anonymous            | Foreword from Annette Nazareth | ge              | For both expertise and capacity reasons, the ICVCM should limit itself to assessment of the governance and standards of carbon crediting programs themselves. It is difficult to see how its current approach could possibly work, and even if it did, its results would not be desirable.                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                             |
| 148 | Anonymous            | Foreword from Annette Nazareth | ge              | With regard to process, we further note that the ICVCM has chosen a very unwieldy procedure for gathering public comment, with little apparent thought devoted to the unnecessary burden it imposes on stakeholders. The document fields are poorly organized, and while it is appreciated that the IC scheduled webinars to explain how to use the BSI site, a good process should be self-explanatory. Submitting feedback through a website in this way also vastly complicates the process of ensuring internal alignment with public comments.                                                                                      | 0                                                                                                                             |
| 148 | Anonymous            | Foreword from Annette Nazareth | ge              | The language used in this document, furthermore, is unnecessarily complex (the use of "mutatis mutandis" perhaps being the most indicative example, but far from the only one) and may have the effect of restricting valuable feedback, especially from experts who may be less confident in their command of English. Clear and direct language should be employed throughout the next draft, along with a far more streamlined comment submission process. These changes would greatly improve the accessibility of this process and, very likely, the quality of feedback.                                                           | 0                                                                                                                             |
| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | Not seeing an obvious place to attach a letter with general comments, i am the taking the lead of others and pasting the letter here:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | As per letter pasted above: <a href="https://docsend.com/view/yid4836ytwe65ivu">https://docsend.com/view/yid4836ytwe65ivu</a> |

| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | The purpose of this letter is to encourage the ICVCM to continue the good work to fulfil its purpose to "ensure the voluntary carbon market accelerates a just transition to 1.5C". Embedded in this purpose is the imperative to fundamentally change the economics on the ground in rainforest nations such that rainforests are worth more standing than felled. There are no reasonable scenarios of a sustainable world without these standing forests being saved. The work is necessarily complex, but as is stated on the homepage, the theory of change is deceptively simple: "build integrity and scale will follow".         | 0                                                                                                                             |
| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | Continued Gratitude, Hope and Concern for the work of ICVCM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                             |

| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | Just over a year has passed since the public consultation phase for TSVCN; and again would like to express my ongoing gratitude for the dedication and hard work of those working at the center of this process under the leadership of the team and the Board. There has clearly been an effort to include diverse viewpoints. I was particularly impressed when Mr. McDonagh attended a recent dinner of rainforest nations to personally solicit opinions directly from the countries on the supply side of the forest debate. I do hope that efforts like the event I witnessed yield results that move us to a unified way forward. As before, I remain concerned that the nature of the BSI-administered process sets up well-trained, well-resourced, persistent, vocal entities for success; while discouraging many others whose voices we need to be heard.                                                                 | 0               |
| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | Key points that do not fit in a line-by-line review of the BSI process:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | 1 We can't build integrity if we don't anchor to the Paris Agreement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | The world needs one set of emissions and one set of accounts. VCMs should not be able to play outside the UNFCCC and one coherent global carbon budget. Set up within the PA is a method for host countries to account for all that is happening in their jurisdiction, from forest preservation to logging and more. Buyer countries can buy credits through Corresponding Adjustments and one ton is accounted for, with integrity, across the system. While it is admirable to see full alignment with NDCs as part of the Assessment Framework there is currently no requirement to register CAs. If we allow parallel systems and do not require CAs, we leave open double-counting at a truly massive scale. Host countries must adjust their NDC when a credit is used as an offset, irrespective of the buying entity being public or private sector: an exclusive claim on a ton of CO2 and consistent global carbon budget. | 0               |
| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | 2 Scale will not follow from integrity alone; if not anchored to national-scale participation in PA                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | Voluntary market retirements for forests have totaled <250m tons to date (Verra AFOLU 2009-current). Despite rhetoric (often from those that are long on carbon credits or whose income otherwise depend on the market), volume is trending down on prior year. UN REDD+ has issued >9bn credits since inception – but unfortunately for the issuing countries, only 4% have been paid for by other Parties. Looking forward (and with reference to the latest announcements from Gabon), it is the nationally authorized & issued schemes that will both bring scale to the market, and consistency with the global carbon budget.                                                                                                                                                                                                                                                                                                   | 0               |
| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | Article 6 of the Paris Agreement recognizes the critical role national governments must have in the creation and use of carbon credits. The ICVCM should make clear that eventually only carbon credits coming from mechanisms created under the Paris Agreement (Article 5 and Article 6.4) should qualify for CCPs. Additionally, all international transfers of carbon credits must adhere to the guidelines of 6.2. The future is nationally-issued carbon; potentially with flourishing 'jurisdictions'/nested-projects'/projects' underneath each nation, as that nation authorizes. Simply nesting projects together will not create credible scale.                                                                                                                                                                                                                                                                           | 0               |

| 149 | Anonymous            | Foreword from Annette Nazareth | ge              | Markets perform better and more fairly for all participants in 'full sunlight'. I believe that ICVCM can and should insist on complete transparency on costs of program and use of net proceeds. Especially critical for nature-based projects in local communities, this will ensure the relevant government and/or developer will clarify and publish what percentage of the proceeds reach national, provincial and local accounts. To be clear, if the economics of keeping a tree alive does not change at a local, provincial and national level, then we will not be able to slow, stop and reverse deforestation.                                                                                                                                                                                                                                                                                                             | 0               |

| 149 | Anonymous                | Foreword from Annette Nazareth | ge              | There are clearly faults to a pure bottom-up project-based approach; as there are also drawbacks in a pure countries-only-based approach. But so long as we view it as an either/or debate - or worse, if projects are 'allowed' in phase 1 of the ICVCM process, and national UN REDD+ are 'excluded' – then we will find it harder as a world to have the tough and good conversations about how the Paris Agreement and Projects can come together to provide a market with integrity, scale and speed. As in physics, the best route is not always a straight line. We need to work out how can the VCMs exist within, and anchor to, the Paris Agreement; and how can countries working under the PA create credits that are more attractive to the private sector. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 149 | Anonymous                | Foreword from Annette Nazareth | ge              | As I see it, the ICVCM process can emerge from this phase of the process in one of three lanes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 149 | Anonymous                | Foreword from Annette Nazareth | ge              | 1)Hardly anyone starts “in”, as CCPs are so stringent: arguably not advisable, if we want to get to scale within the decade                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 149 | Anonymous                | Foreword from Annette Nazareth | ge              | 2)There is flexibility / an “in” designation in phase 1 for a chosen few, with UN REDD+ not included: this would be drive a wedge between the two schools of thought that need to come together. I would fear that many host / supply countries would withdraw from the process, and irrevocable harm would be done                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 149 | Anonymous                | Foreword from Annette Nazareth | ge              | 3)There is flexibility / an “in” designation for a chosen few, including UN REDD+: this would seem the best outcome as it would signal a pursuit of quality, but also a recognition that there are two worldviews that can and should be reconciled as we progress to phase 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 149 | Anonymous                | Foreword from Annette Nazareth | ge              | 4)There is flexibility / “in” designation phase 1 for many (including UN REDD+): this would seem to be a compromise acceptable to many; as long as there is a roadmap for how credits need to improve for phase 2 and included recognition of how national REDD+ programs are fundamentally different from project approaches.                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 149 | Anonymous                | Foreword from Annette Nazareth | ge              | The world needs the Paris Agreement to succeed, and the world needs private sector capital to willingly move at scale to developing countries and their communities so that we can preserve the world’s primary forests. The ICVCM aims are in line with this goal, but the current construct of the CCPs and AF (if they exclude UN REDD+, as they currently appear to do) are not.                                                                                                                                                                                                                                                                                                                                                                                     | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 150 | Jose Lindo               | Part 1: Introduction           | ge              | It would be advisable that, given the slowness of the parties in their training for compliance with Article 6, the proposal that the ITMOs can be based on the excellent work of the CCPs be made clearer. In my conversations with politicians or countries, it is not clear to me that they are understanding the opportunity to achieve rapid capacity building by taking advantage of the TSVC and now IC-VCM framework. This is simply an opinion or interpretation upon reading.                                                                                                                                                                                                                                                                                   | I do not have a proposal for change, but rather for a broadening of ambition, unless you do not want to influence the negotiations. Thanks!                                                                                                                                                                                                                                                                                                                                                                                                              |
| 151 | Anonymous                | Part 1: Introduction           | ge              | Good Carbon Credits are driven by Good Behaviours and practices that lead to smart carbon practices and nature based solutions. Behaviours come first, then the biodiversity and then the Carbon. Emphasis should be placed on encouraging the adoption of the right behaviours and practices for a given ecosystem.                                                                                                                                                                                                                                                                                                                                                                                                                                                     | I am not sure what changes are required. However, maintaining an existing Mature Natural Resources [Well functioning Prestine Forrest or Mangroves] will produce alot more carbon credits and cashflow than a brocken Ecosystem that needs intervention to get it functioning again and then time to reach maturity. The question is, how to we incentivise investors to engage in fixing broken ecosystems also. Perhaps we need credits for Behaviour/Social and Biodiversity impacts which will help with the initial funding and liquidity required. |
| 151 | Anonymous                | Part 1: Introduction           | ge              | Much of our wildlife and agriculture lands are broken and need intervention to get them fuctioning again before they will start to offset carbon.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 151 | Anonymous                | Part 1: Introduction           | ge              | How do we put a monetary value on the right behaviours [Activity, Output,Outcomes] that will eventually drive impact [Carbon], ecosystem health and climate positive outcomes. The lag phase to rejuvenate a broken ecosystem will take time before producing economic quantities of Carbon, so providing early liquidity is required to incentivise good behaviours and best practice.                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 152 | Our 2050 World core team | Part 1: Introduction           | ge              | The Net Zero Guiding Priniciples (IWA 42) working draft 2 currently refers to the ICVCM core carbon principles and assessment framework in its guidance on credits, measuring and monitoring, and annex of further resources. The CCPs and associatied documents should look to align as far as possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                | See 2 proposals in bold.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 153 | Rosa Maria Roman-Cuesta  | Part 1: Introduction | ge              | While mitigation integrity is clearly needed, a few extra ideas would need to fly in parallel with this debate. 1. Selected demand. high integrity in voluntary carbon offsets should only be a reward for high integrity operators. Operator that have (large) deforestation and biodiversity footprints in their value chains should be fully banned from accessing (any) but certainly high quality offsets. Particularly ridiculous would be agroporations requesting high quality offsets from land projects. 2. We need to find a compromise to re-enter the no (low) risk forests into the climate finance. Additionality is killing the conservation of standing forests under low risk, which are some of the ones we need to protect the most. 3. High integrity carbon offsets derisk the demand and protect the operators, but we urgently need to find a way to derisk the supply (and protect land investment in risky areas) Promoting high integrity carbon offsets fully de-incentivizes land investments, mostly in high-risky forests, where funding is needed the most. | Idem                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 154 | Rosa Maria Roman-Cuesta  | Part 1: Introduction | ge              | Under the 2015 Paris Agreement, countries agreed to cut greenhouse gas emissions with a view to 'holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | "Please return to the PA text "well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels"                                                                                                                                                                                                                                                                                                                                                              |
| 154 | Rosa Maria Roman-Cuesta  | Part 1: Introduction | ge              | There is ample evidence that we are far beyond any option for the 1.5C target. I find it unrealistic to have a brand new document that focuses on the impossible 1.5 target. Please return to the PA text "well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels"                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 155 | Rosa Maria Roman-Cuesta  | Part 1: Introduction | ge              | I understand the report is trying to be conflict-free but there is certain need for clarification and a discussion to be held as why the ICVCM is better positioned than carbon standard organizations with 20 years of experience in developing and implementing Carbon offsets methodologies and third party certified/verified credits.I do not see them even cited in your list of external influences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | I understand the report is trying to be conflict-free but there is certain need for clarification and a discussion to be held as why the ICVCM is better positioned than carbon standard organizations with 20 years of experience in developing and implementing Carbon offsets methodologies and third party certified/verified credits.I do not see them even cited in your list of external influences.                                                                                                                         |
| 156 | Javier Castro            | Part 1: Introduction | ge              | The last sentence is misleading, "more effective economic incentives" can be understood as less expensive, which would reduce the interest of acting in their own value chain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Wording should be clear in order to avoid misunderstanding and also to avoid that the sentence can be interpreted as "companies can claim reduction of their value chain emissions and at the same time get economic incentives from the VCM", which would be a clear double counting/claiming                                                                                                                                                                                                                                      |

We propose a better yardstick that promises a specific, uniform, and consistent measure of impact across all carbon projects.                                                                                                                                                                                                                                                       |

Buyers have no assurance about a carbon credit bought today – it could represent one tonne of carbon dioxide stored out of the atmosphere for 20 years, 100 years or 10,000 years, and there's no guarantee of when the impact occurs, which in some cases can be more than a decade into the future or a decade ago.                                                                                                                         |
| 157 | Anonymous                | Part 1: Introduction | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | This puts an onerous burden on buyers to tread carefully or pay-up for advisors to navigate the shifting and nuanced carbon markets. Climate pioneers like Microsoft, Stripe, etc. can bear the burden, but the average company cannot. Either way, the lack of standardization causes higher transaction costs, increased confusion, greater market manipulation, lower credibility, lower volumes of purchased credits, and ultimately less progress against climate change.                                                      |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | In short, we're using a broken yard stick, and it's creating a credibility gap that is limiting the growth of carbon markets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | But there's a better yardstick – we call it Carbon 2.0 – and it's ready to adopt today. It won't standardize all project-related issues such as additionality and leakage, but it will standardize the purported impact of the project and solve permanence at the same time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Carbon credits were designed to be a commodity – indistinguishable, of equal value, and thus fluidly marketable.[1] A true commodity would allow market forces to most efficiently allocate capital to projects, and most efficiently combat climate change.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | However, carbon credits are no commodity today. Their values vary based on differentiable attributes like geography, technology, duration, and volume. We've identified 18 attributes in Figure 1 below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Figure 1 – A carbon credit's value is the product of 18 distinct attributes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Not all carbon credits are equal                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The 18 attributes identified here create an enormous amount of variability in the impact and quality of each credit. For example, if a buyer is trying to assess the relative value of two credits, like the renewable energy credit and a direct-air-capture credit illustrated below in Figure 2 below, it's nearly impossible. And buyers typically aren't challenged with assessing credit value across just two types of projects; rather they are seeking to build a blended portfolio from dozens of options. Without any standardization, buyers face the impractical task of evaluating the impact of each carbon credit individually. As mentioned above, this results in higher transaction costs for buyers and less climate impact overall.                                                                                            |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Figure 2 – Buyers face the challenge of determining the relative value proposition of credits across so many attributes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | If we are to remedy this flaw in carbon markets, we need to think about how to standardize the measurement of carbon. To do so, we must consider these attributes in three groups: one comprised of objective, quantitative attributes (what we've called here "yardstick attributes"), another including quality criteria, and a final group of demographic attributes. We need standardization across each of these groups of attributes.                                                                                                                                                                                                                                                                                                                                                                                                         |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | For the demographic attributes, the key is transparency, which must occur on a methodology-level and/or project-level basis, so that buyers can identify what credits they are buying. The group of quality criteria is a tougher challenge – one that we will not attempt to address here. However, existing standards bodies – like Verra, The Gold Standard, The Climate Action Reserve, and The American Carbon Registry – are working constantly to standardize quality. Moreover, a new wave of emerging, tech-focused entities, such as Sylvera, BeZero, and Pachama, seek to reinforce and improve on the standards bodies' efforts. Ultimately, this also requires rigorous standards on the methodology-level and/or project-level, and may eventually merit gradation of carbon credits, rather than today's binary certification model. |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | For the first group of attributes, however – the yardstick attributes – the answer is much simpler. And we can adopt it across the carbon market today.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Measuring volume, duration, and timing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | There are three yardstick attributes: volume, duration, and timing.[2] Of the three, our current system accounts for volume well, but not so duration and timing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Figure 3 – Today's standards account for 1 of 3 "yardstick attributes"                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Why? Today's standards for carbon credits originate from simpler times when a credit simply meant avoiding an emission of carbon dioxide into the atmosphere.[3] As a swelling number of entrepreneurs and innovators discover new ways to avoid emissions and remove carbon dioxide already in the atmosphere, attributes that were once standard – duration and timing – are now variable. Even so, we will need to account for each attribute to standardize the measurement of impact.                                                                                                                                                                                                                                                                                                                                                          |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Fortunately, we have the tools to do so: the adoption of tonne-year accounting, coupled with a discount rate representing the social cost of carbon will effectively measure duration and timing, as well as volume. The marriage of these two mechanisms is what we call "Carbon 2.0." It functions as a Rosetta Stone for carbon projects, translating impact across any duration, any volume, and any time period into a common measure of impact.                                                                                                                                                                                                                                                                                                                                                                                               |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The first tool in Carbon 2.0 is tonne-year accounting or “TYA”. A tonne-year is a single tonne of carbon dioxide stored for one year. One tonne stored for one year equals one tonne-year.                                                                                                                                                                                                                                                                                                                                                                                 |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Any project – every project – can be measured using tonne-year accounting because every project has both volume and duration attributes, whether both attributes were measured historically or not. For example, a typical forestry credit that stores one tonne of carbon dioxide in a forest for 100 years is creating a carbon credit made up of 100 tonne-years (See Figure 4 below). In this example, the “equivalency ratio” is 100 tonne-years per carbon credit.                                                                                                   |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Figure 4 - Illustration of a typical forestry credit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Another project under a different methodology certified by a different standards body may store one tonne of carbon dioxide for 40 or 20 years. Because these projects are, in fact, credited, those credits are worth 40 tonne-years and 20 tonne-years, respectively.                                                                                                                                                                                                                                                                                                    |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Herein lies the problem: not all carbon credit standards or protocols enforce the same equivalency ratios across credits. In fact, most neglect the concept of equivalency ratios entirely, incentivizing project developers to create low-impact credits with the shortest contract length possible. With varying equivalency ratios or no equivalency ratios at all, the quality of carbon credits varies widely and trends downward.                                                                                                                                    |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Tonne-year accounting (TYA) uniquely and elegantly standardizes this impact by trading off duration with volume. That is, one can use TYA to create high-quality equivalencies of projects with shorter durations by compensating with increases in volume. For example, a project that stores carbon dioxide for one year would require 100 tonnes of carbon dioxide to maintain the equivalency ratio equal to 100 tonne-years per credit (see Figure 5).                                                                                                                |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Figure 5 – Illustration of 100 tonne-years in a different carbon credit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Alternatively, you could have credits representing 10-year durations and 10 metric tonnes or 5-year durations and 20 metric tonnes. Four quarters, 10 dimes, 20 nickels – it’s all a dollar. The point is that TYA creates the flexibility to trade off duration and volume in such a way that standardizes the climate impact per credit, regardless of project duration.                                                                                                                                                                                                 |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The effect on atmospheric temperatures                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | We wish it were as easy as that: simple algebra to equate a project’s impact across volume and duration. However, we must also consider the influence of the carbon dioxide stored out of the atmosphere on temperature rise. This is complicated by the fact that carbon dioxide’s warming effect on atmospheric temperatures, a concept called “global warming potential”, diminishes over time (see Figure 6).                                                                                                                                                          |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | With volume and duration accounted for, we’re left with timing. And timing matters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Timing matters for two reasons. First, as just mentioned, the global warming potential of carbon dioxide in the atmosphere diminishes over time. Second, the societal costs of doing nothing increase over time, which is why climate change is an urgent issue.                                                                                                                                                                                                                                                                                                           |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The IPCC estimates we have until 2050 to reach net zero to limit Earth’s average temperature increase to 1.5-2.0° Celsius above pre-industrial levels. With any further increase, we hit a tipping point of accelerated temperature rise. 2050 is 28 years away. We’ve got a countdown clock, and the next decade is 35% of the time left before the buzzer sounds.                                                                                                                                                                                                        |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The concept of valuing when climate impact occurs is called the “time-value of carbon”[6] and parallels the time-value of money. Simply illustrated, would you prefer \$100 today or \$100 in 10 years? You’d like it today because it’s worth more in your pocket where you can use it. What about \$100 today versus \$105 in ten years? That’s tougher, but you may still prefer \$100 today. At some number though, say \$1,000, you’d clearly prefer the money in 10 years, because that represents a growth rate above 25% compounded every year for those 10 years. |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The same is true with carbon. Carbon impact in the near-term is more valuable than carbon impact created over the long term – all else equal – because it gives us greater optionality and more time to innovate new climate solutions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Because timing matters, we need to measure it, and today's carbon crediting systems do not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The closest mechanism for time-value of carbon today is the 100-year global warming potential standard, adopted by Verra and others.[7] However, there are three primary issues with this approach.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The first issue is the 100-year standard is arbitrary. Its origin dates to the 1990s when the IPCC proposed three scenarios by which to consider the impact of carbon dioxide emissions: 20-year, 100-year, and 500-year scenarios.[8] This arbitrariness creates arbitrary incentives for carbon project developers. For example, many forestry projects are required to contract with landowners for a period of 100-years, an unrealistic time horizon for most timberland owners, who are not willing to shackle their property or descendants with liabilities over the next century. This barrier to participation excludes willing participants in carbon markets and fails to unlock new sources of climate action. |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | A second issue with the 100-year standard is its binary cutoff. It essentially overvalues the benefit for the project during the first 100 years (using a 0% discount rate) and then devalues the benefit thereafter (100% discount rate). This implies that Year 99 is infinitely more valuable than Year 101. The binary cutoff oversimplifies the nature of carbon impact and lacks the capacity to measure it in a more nuanced, accurate manner.                                                                                                                                                                                                                                                                       |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | A third issue is that not all carbon projects fit the 100-year convention, and increasingly innovative projects – like soil carbon – defy it entirely. In the absence of an effective mechanism to value timing, project developers have no incentive to create projects with badly needed near-term impacts.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | For example, a project that can deliver the same physical impact in a shorter time period (let's say five tonnes of carbon dioxide for 20 years compared to a project with one tonne for 100 years) is not valued any more in today's systems of measurement, despite delivering the impact entirely before the IPCC's buzzer sounds in 2050.                                                                                                                                                                                                                                                                                                                                                                               |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | In another less obvious example, a direct-air-capture credit, which stores carbon dioxide for 10,000 years, can claim to be 100x more impactful than a traditional credit worth 100 tonne-years. However, this fails to account for the value of near-term impacts over long-term impacts. In this case, 99.7% of that credit's benefit occurs after the buzzer sounds in 2050. There is certainly considerable value to that tail of benefit, but the value of each year is less beneficial the further the impact is into the future. And if you think 10,000 years is long, some projects claim infinite durations!                                                                                                      |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | In short, we need standards that not only account for volume and duration, but also accurately reflect the value of timing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The timing solution: A discount rate representing the social cost of carbon                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | There is broad support that a more accurate mechanism to account for the time-value of carbon is a discount rate applied consistently across each year throughout the effective lifetime of the project. [9],[10]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | This mechanism is the same used by our most sophisticated financial systems to determine the time-value of money. That is because it accurately reflects the continuous, rather than binary, nature of time. In short, it's a proven, tested mechanism.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The largest barrier to adopting this solution is a lack of consensus on the appropriate discount rate. It is, in essence, a question of the value of urgency. A discount rate set too high risks incentivizing urgency too strongly at the expense of long-term benefits. A discount rate set too low risks the opposite: a weak signal for urgency and bias for long-term impacts at the expense of near-term impacts.                                                                                                                                                                                                                                                                                                     |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | What's the right discount rate?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | But should it be 1% or 5% or 50%?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | There's no perfect answer, per se, as this is a measure of the urgency of climate change which is yet unknown – and hopefully will remain so! However, we can rule out wrong answers and triangulate close to the right answer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | To eliminate wrong answers on the low side: we know 0% is too low because we know climate change is urgent. If it were 0%, we'd solve climate change in 10,000 years or never, but certainly not today. We can also assume that rates near 0 are too low, and so set a floor at 0.5% or so.                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | On the high end, we can assume that discount rates used in corporate finance – typically ranging from 6-12% – are too high, because they are typically used for investments over a shorter time horizon, while organizations like utilities using rates on the lower side of the range for long term infrastructure projects that might span 30 or 50 years.                                                                                                                                                                                                                                                                                                                                                         |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | So now we can conclude the rate should be somewhere between 0.5% and 6%. Within that range, we can triangulate from other sources. The mathematical equivalent of the binary 100-year global warming potential is a 3.3% discount rate. [11],[12] And the social cost of carbon was calculated by the US Government as 3.0% annually, which is to say that the environmental and societal cost of waiting increases 3% every year if no action is taken. [13]                                                                                                                                                                                                                                                        |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Thus, we find two sources near the midpoint of the 0.5-6% range at 3.0% and 3.3%. Between the two, we recommend the 3.0% discount rate to reflect the environmental and societal cost of rising temperatures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | More importantly, we recommend the adoption of any discount rate over the confusion and inefficiency of not accounting for the time-value of carbon. Then, we can collectively refine and tweak this number as needed to reflect the latest research and knowledge.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Re-defining a carbon credit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Finally, we need a new definition of a carbon credit. If the idea is to propose a definition that equates to the permanent (i.e., infinite) reduction of one metric tonne of carbon dioxide, then, mathematically speaking, there is no amount of volume that will ever compensate using a duration shorter than infinity. So, instead we propose a new, pragmatic definition:                                                                                                                                                                                                                                                                                                                                       |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | A carbon credit is a permit or certificate to emit greenhouse gases equivalent to the global warming potential of one metric tonne of carbon dioxide and is generated by delivering the equivalent global warming potential of one metric tonne of carbon dioxide released into the atmosphere indefinitely, rounded to one-thousandth of a tonne.                                                                                                                                                                                                                                                                                                                                                                   |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | This definition has three primary benefits. First, it is specific and thus eliminates the fungible ambiguity of the conventional definition that is so often manipulated by developers and buyers alike. Second, it is universally applicable, broad enough to encapsulate projects of any volume, any duration, and any time period. And lastly, it is inclusive of existing carbon credits that truly offset the emissions of a tonne of carbon dioxide.                                                                                                                                                                                                                                                           |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Bringing it all together                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Let's bring it together by reconsidering two projects, both 100 tonne-years, where one was spread out over the next century (horizontal row of tonne-years) and the other occurred entirely next year (vertical column of tonne-years). We determined the second project was more valuable because the impact occurred in the near-term, however, we didn't have a way to assess that value. Now we do, using a discount rate representing the time-value of carbon. Instead of generating one credit from the 100 tonne-years next year, a project would generate 2.96 credits, as shown below in Figure 8. This can be calculated using a simple calculator, such as the one in Appendix A: Carbon 2.0 Calculator. |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Figure 8                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | When we marry these two mechanisms – (1) tonne-year accounting and (2) a discount rate representing the time-value of carbon – we can equate the impact of any project, of any volume, for any duration, across any time period. This is Carbon 2.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Benefits of Carbon 2.0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | This new yardstick is universally applicable across all types of carbon projects. It is not specific to direct air capture or blue carbon kelp projects or terrestrial nature-based solutions. It is universally applicable because TYA and discounting both measure the impact of storing carbon dioxide with greater granularity – TYA by accounting for impact at the more granular tonne-year level and discounting by considering the urgency of climate change on a continuous, rather than discreet timeline.                                                                                                                                                                                                 |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | The best way to demonstrate the new yardstick is to measure existing carbon credits. Figure 9 contains several examples. We have also built a simple excel calculator included in Appendix A: Carbon 2.0 Calculator that can be used to apply the same yardstick to any project.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Ex-post credits are carbon credits that are issued after monitoring and verification has occurred. For many types of carbon credits, ex-post reporting would require issuing the credit after the 100-year contract period, which would of course make the project unattractive to a project developer. When coupled with Carbon 2.0, however, carbon projects can issue credits as often as they perform measurement and verification based on the number of tonne-years delivered ex-post since the last measurement. That is a win for buyers who want irreversible, delivered impact and for suppliers who need near-term cash flow to finance projects. |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Carbon 2.0 eliminates the risk of reversal present with many nature-based solutions today. Consider a traditional forestry project that protects a forest for 100-years issuing credits upfront, ex-ante. There is a risk that wildfire, pestilence, flooding, or a hurricane could reverse the impact of the carbon credit, after the credit has been issued and sold. Today, this risk is managed by “buffer pools” of credits set aside for such instances. These pools effectively act as an insurance policy for carbon reversals. And unfortunately, it appears they have been greatly underestimated.[15]                                             |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | With Carbon 2.0, no buffer pools are needed because the credits issued represent only the carbon dioxide that was not in the atmosphere prior to issuance. If a wildfire burns the forest, no further credits will be issued, of course, but any credits previously issued remain valid.                                                                                                                                                                                                                                                                                                                                                                     |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Without risk of reversal, on-going monitoring responsibilities after the crediting period are no longer necessary. This eliminates substantial cost and an issue that registries have historically struggled to tackle.                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Access and inclusion strengthen the fabric of communities anywhere. And nowhere is that truer than in the global community and its enormous effort to stop rising temperatures. We need all hands-on deck. All hands.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Carbon 2.0 enables a greater variety of projects and a decentralization of projects – think crowdsourcing and grassroots campaigns versus institutional capital and K-Street lobbying firms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Project size is one barrier to participation. For example, one million landowners with 20 acres can have the same impact as ten landowners with two million acres if we create the right access to carbon incentives. What’s more: it’s not exclusive, so we get 40 million acres at work to reverse global warming.                                                                                                                                                                                                                                                                                                                                         |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Another barrier is project duration. Landowners that are not willing to commit to longer project durations are willing to commit for shorter durations. If we could create access for them to do so, they still contribute to the reduction of atmospheric carbon dioxide without shackling their great-grandchildren with legal liabilities.                                                                                                                                                                                                                                                                                                                |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Tonne-year accounting creates access for large and small landowners, long-term and short-term projects to participate in carbon markets. If the need is to open access to all channels for contribution – and it is – then Carbon 2.0 again furthers the cause of climate.                                                                                                                                                                                                                                                                                                                                                                                   |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Carbon 2.0 is a powerful marriage of mechanisms – a Rosetta Stone – that unlocks the ability to translate climate impact across different types of carbon credits. With it, we can equate the impact of any project, of any volume, for any duration, across any time period.                                                                                                                                                                                                                                                                                                                                                                                |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | While we must continue improving standards that normalize other attributes of carbon offsets (such as additionality and co-benefits), Carbon 2.0 is a major step towards commoditizing carbon credits, and it is ready to adopt now. By doing so, we remove the onus from consumers to understand each type of carbon credit and facilitate a more efficient, liquid market that will increase our ability to combat rising temperatures.                                                                                                                                                                                                                    |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Of the four ICROA-approved standards bodies, The Climate Action Reserve has led the way to Carbon 2.0 by adopting tonne-year accounting across several protocols, though not yet incorporating the time-value of carbon. Verra, the largest such body, recently deferred a decision to adopt tonne-year accounting, pending further stakeholder engagement[16]. We call on all standards bodies to adopt Carbon 2.0.                                                                                                                                                                                                                                         |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Specifically, we propose global carbon standards adopt two mechanisms: (1) tonne-year accounting and (2) a uniform discount rate representing the social cost of carbon. Let's replace our broken yardstick with a better one that will increase the effectiveness and scale of carbon markets and give us the best chance of reversing climate change.                                                                                                                                                                                                                                                                                 |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | One critique of Carbon 2.0 is that it enables shorter-term contracts which can undermine additionality. For example, if a landowner only had to defer the harvest of timber for a single day, then he or she could do so at no cost, because the time interval between deciding to harvest timber and the actual harvest is longer than a single day. In that case, if you used Carbon 2.0 to quantify the piecemeal credits generated during that day, it would no longer be additional to the status quo, because the landowner did not change behavior.                                                                              |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | While problematic, attributing this to Carbon 2.0 conflates two issues: additionality and the quantification of carbon impact. Additionality and other qualitative standards should be set at the methodology level. In contrast, the "yardstick attributes" – volume, duration, and timing – can be universally used to standardize how we quantify the carbon credits.                                                                                                                                                                                                                                                                |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | In the example above, it is appropriate to have a minimal contract period that should in all cases exceed the time interval between a landowner's decision to harvest timber and the actual harvest. For example, if it takes two months for harvest to occur, the contract period should be significantly and conservatively greater than two months.                                                                                                                                                                                                                                                                                  |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Carbon 2.0 is physically inconsistent with the emissions it offsets                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Another critique is that Carbon 2.0 accounts for the economic impacts of offsetting carbon dioxide emissions, rather than the physical properties equivalent to emissions, i.e., an equal number of greenhouse gas molecules in the atmosphere.[17] Specifically, this critique relates to the practice of discounting, which is ultimately an economic consideration.                                                                                                                                                                                                                                                                  |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | This critique is correct, and ultimately the question of physical equivalency or economic equivalency is subjective. We believe that the environmental and societal cost of rising temperatures (economic) is a more appropriate yardstick than the precise volume of carbon dioxide molecules in the atmosphere (physical) because the costs of climate change exceed the benefits. The social cost of climate change is inherently an economic question, "What cost will society incur as climate changes?" Therefore, the appropriate benefit of an emission's offset should be economically equivalent to the cost of the emission. |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Carbon 2.0 is designed to create economic equivalency – not physical equivalency – between the cost of one tonne of emitted carbon dioxide and the benefit of a carbon credit, regardless of the credit's volume, duration, or timing.                                                                                                                                                                                                                                                                                                                                                                                                  |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Short-term storage of carbon dioxide causes a spike in temperatures                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Another critique is that short-term storage of carbon dioxide in nature-based solutions ultimately results in an increased atmospheric temperature at the end of the storage period. This is true when isolating for a given tonne of carbon dioxide over a single period. It also holds true for projects that store carbon dioxide for 10 years, 50 years, or 150 years. See Figure 11 below, created by CarbonPlan.org[18].                                                                                                                                                                                                          |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | However, this critique has two flaws. First, a portion of the temperature increase is caused by the incremental release of carbon dioxide that would have remained in the atmosphere without the project. That is because throughout the project, the trees grow and continue to sequester carbon dioxide. It is only released at the delayed harvest date because it was first removed from the atmosphere, where it would have remained, contributing to global warming. This is a benefit of the project, not a cost.                                                                                                                                                                             |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Second, and more importantly, this critique takes a narrow perspective on what would happen to a specific unit of carbon dioxide over a specific time threshold. A broader programmatic or systemic view, however, would show a net long-term reduction in atmospheric carbon dioxide. Using the example above, one acre of forest may be harvested after ten years, while another is enrolled in the program on a rolling basis to replace it, and another after that, and so on.... The net impact at a programmatic level is a net reduction in atmospheric carbon dioxide for the duration of the program, not any specific project.                                                             |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Short-term storage is less valuable than longer-term solutions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | First, we need all solutions, and if short-term storage does not cannibalize long-term storage, then we should welcome it into the tent of solutions to combat climate change.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Second, all carbon credits represent the storage of carbon dioxide, whether the duration of that storage is one year or one hundred thousand years. And all durations have some value, however small, so long as they satisfy the requirements for high quality credits. Thus, the challenge is not to decide which projects do and do not meet arbitrary duration thresholds, but rather to measure the value of carbon dioxide storage appropriately across all thresholds, as Carbon 2.0 does.                                                                                                                                                                                                    |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Third, the near-term impacts of carbon dioxide storage are more valuable than the long-term impacts of carbon dioxide storage. Delaying the harvest of a forest for just ten years is 35% of the time before the IPCC's target in 2050. That is a critical window in which policymakers, technologists, investors, and entrepreneurs can progress the fight against climate change. In short, ten years of short-term storage today is many times more valuable than the storage during years 990-1,000. So long as the shorter duration is accounted for, as it is in Carbon 2.0, then this impact is incrementally helpful and welcome.                                                            |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Environmental systems are complex, and there is much we do not know                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | No counterargument here; this is simply true. However, that is no excuse for not standardizing the impact of carbon credits based on what we do know. With further research, we will undoubtedly learn more about radiative forcing, global temperature rise, and the social cost of climate change. However, in the meantime, we must adopt a framework for measuring climate impact that is standard across projects and time periods.                                                                                                                                                                                                                                                             |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Radiative forcing may correlate with temperature but cause other problems                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Another critique is that Carbon 2.0 is based on the radiative forcing of carbon dioxide in the atmosphere, which directly relates to temperature increase, but may not account for other issues related to increased carbon dioxide in the atmosphere. For example, more carbon dioxide in the atmosphere, even if we control for radiative forcing, may acidify the oceans. These are valid concerns that require more research. Then, we need to appropriately revise our frameworks considering that research. For now, the primary intent of carbon credits is to limit the global rise in temperatures, and it seems that radiative forcing is the best framework through which to assess that. |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | A final critique of Carbon 2.0 is that the math behind it is very complex... radiative forcing curves and Lashof models and what not. True, it is more complicated than today's standards, where one tonne of carbon dioxide equals one carbon credit, regardless of storage duration or delivery timeline. However, Carbon 2.0 measures the true impact of a carbon credit's effect on temperature in a way that offers standardization, greater accuracy, and greater access to carbon markets.                                                                                                                                                                                                    |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Moreover, the math can be managed at the point of verification using simple, user-friendly tools like the Carbon 2.0 calculator included in Appendix A: Carbon 2.0 Calculator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 157 | Anonymous            | Part 1: Introduction | ge              | 0                 | Most importantly, this greatly simplifies the entire process for the most critical stakeholder group: buyers. With Carbon 2.0, buyers will no longer need to understand the nuances, variations, and hidden assumptions of carbon markets; rather they will simply buy standardized, commoditized carbon credits.                                                                                                                                                                                                                                                                                                                                                                                    |

| 157 | Anonymous            | Part 1: Introduction | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | [18] Carbonplan.org, Verra Ton Year Comment Letter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 158 | Aya Yamazaki         | Part 1: Introduction | ge              | While agreeing to the need to establish principles for highly integral VCs, I would like to underline that such work is associated with a difficult and important balancing act between quality and quantity. Global energy transition requires huge amount of money, and VCs are expected to play an important role to canalize abundant liquidity in financial/capital markets for the purpose. My concern is that, if excessive consideration is made in favour of quality in terms of addtionality, environmental integrity, development effect etc., the quantity aspect would be seriously hampered. Without enough supply of VCs, many of transition projects would not concretize, leading to geopadizing the achievement of the Paris Accord goals. CCS projects are typical in this context; those entities in need for reduction of their emissions are not identical to those in charge of storage/sequestration; only with the intermediation by VCs, such projects can take place. | The last sentence of the draft introduction which limits the use of VCs to value chain only, while being prohibitive to that for Sope 1 and 2 offsetting, should be deleted. For the transition, VCs are needed for Scope 1 and 2 reduction.                                                                                                                                                                                                                                                                                                            |
| 160 | Anonymous            | Part 1: Introduction | ge              | We fully support the need for transparency around the quality requirements for climate projects, and the idea of standardization across existing crediting programs. Having clearly defined principles will improve the general understanding of the integrity attributes of carbon projects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Point 1: We urge the council to invite more input from project developers (including small innovative companies) and implementing agencies of high-integrity projects, and to hear their suggestions on (1) cutting red tape in certification processes that goes against the very objective of successfully implementing high-integrity projects, and (2) reducing other barriers to project development and innovation in the existing certification programs.                                                                                        |
| 160 | Anonymous            | Part 1: Introduction | ge              | However, we have the following feedback to the principles-based approach by the Council, and also some concerns about certification programs and VCM in general:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Point 2: We urge the council to undertake policy advocacy at the international and national level to define and introduce such mechanisms, and center efforts on these parts of the market. Can the Council play a role here? There is too much focus on making the supply side of the market bullet proof, but the rest of it remains completely ungoverned.                                                                                                                                                                                           |
| 160 | Anonymous            | Part 1: Introduction | ge              | 1. The existing certification programs require significant paperwork to start and monitor projects. Many requirements are also very complex, sometimes not clear and open to interpretation. The certification process can be very complex and lengthy, and ultimately deter new high-integrity project developers from entering the market. It definitely reduces innovation and raises costs (if consulting companies are invited).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | If there is a new layer of certification, we suggest that it only applies to projects or project types that are prone to fraud or low integrity situations, instead of crediting programs in general. We would like to see a more selective, risk-based approach in the way the assessment framework and ist procedure is applied. Again, we are for transparency and integrity, but not through means that come at their cost.                                                                                                                         |

| 160 | Anonymous            | Part 1: Introduction | ge              | 2. We are not clear how the addition of another certification system above existing ones will improve the VCM market overall. Clear principles increase understanding, but what is needed is proper market oversight (not just over project developers and implementes, but traders and intermediaries in particular) and enforcement mechanisms.                                                                                                                                                                                                                                                                                                                                    | Thank you for the opportunity to comment. We hope that you can consider these genral comments and perhaps mention the intention to address these issues in the document.                                                                                                                                                                                                                                                                                                                                                  |
| 161 | Anonymous            | Part 1: Introduction | ge              | In absence of a specific place to make collective comments, we have included these here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | See comments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 161 | Anonymous            | Part 1: Introduction | ge              | 1. XXX welcomes the draft Core Carbon Principles (CCPs), Assessment Framework and Assessment Procedure. We believe that avoiding and reducing greenhouse gas emissions should always be prioritised before purchasing of carbon credits. However, particularly for sectors where there are limited near-term technologically or financially viable options to abate greenhouse gas emissions, high quality voluntary carbon credits can be an important tool to raise and accelerate climate action.                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 161 | Anonymous            | Part 1: Introduction | ge              | 2. We recognise the breadth and depth of the CCPs and thank the Integrity Council members for their work to date on this important topic. In that context, we offer the reflections below:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 161 | Anonymous            | Part 1: Introduction | ge              | 1. Given the breadth and depth of the CCPs and AF, we would encourage the IC to set some targets for the assessment procedure work plan, and how it will prioritise according to the market share of a credit type or program, and to transparently publish such assessments including rationale for areas where subjective decisions are necessary.                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 161 | Anonymous            | Part 1: Introduction | ge              | 2. Given the current circumstances across the voluntary carbon market, we understand the need to provide a two-phase approach for certain requirements. However, we note that by identifying criteria for 'full' implementation, you raise the spotlight on potential inadequacies in 'partial' implementation. As such, we would encourage the IC to accelerate to the greatest extent possible 'full' implementation.                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 161 | Anonymous            | Part 1: Introduction | ge              | 3. Related to point (b), we would appreciate IC to clarify why access to an independent grievance mechanism was allocated as a 'full' requirement given its importance in strong program governance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 161 | Anonymous            | Part 1: Introduction | ge              | 4. In relation to VVBs, we wonder if there is an opportunity to signal even greater independence, e.g. having a Standard body appoint them rather than project developers, or other options to further avoid conflicts of interest.                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 161 | Anonymous            | Part 1: Introduction | ge              | 5. We would encourage the IC to consider minimum standards surrounding security and access for registries and other technology platforms across the value chain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 162 | Anonymous            | Part 1: Introduction | ge              | XXX Feedback on ICVCM Assessment Framework                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | We think that ICVCM should take an implementation role rather than duplicating CORSIA EUC & ICROA codes and that too with impractical ideas. They can focus on checking robustness of methodologies of GHG programs, building Verification competency requirements and capabilities and carry out sample checks on registration of projects, assessment of their sustainability contribution and carbon credit issuances. We also think that there is no need of separate GHG program eligibility assessment under ICVCM. |
| 162 | Anonymous            | Part 1: Introduction | ge              | XXX appreciates ICVCM's initiative to improve the integrity of voluntary carbon markets and the draft assessment framework published by it. We believe that while the intentions are good, the aim to achieve the bookish perfectionism hampers the carbon market efficiency and create impediments in issuances thereby restricting financial flows that are desperately needed for to scale up climate action. We have following fundamental comments on the framework, which we believe should be addresses as first priority by ICVCM. Having said that we remain committed to contribute to further development of ICVCM framework that is devoid of following critical issues. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 162 | Anonymous            | Part 1: Introduction | ge              | Impracticality and duplication of efforts:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 162 | Anonymous            | Part 1: Introduction | ge              | The framework is too impractical to implement with many impossible ideas e.g., the definition of "likely" or "not likely" additional projects and developing baselines to follow NDC trajectory or LEDS (in second phase). We sincerely believe that corresponding adjustment is playing an important role to ensure that no crediting and transfer of credits conflict with NDC. Voluntary credits do not have an issue of double accounting, if purchased purely for corporate product/services carbon neutrality.                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 162 | Anonymous            | Part 1: Introduction | ge              | We believe that there is too much duplication of CCPs with CORSIA's EUC & ICROA's code of best practice, which means CCPs should build additional elements over them, but not duplicate them. It remains unclear, why GHG Programs should be required to subscribe to multiple accreditations and duplicate their efforts. CORSIA has similar framework but it has considered implementation aspects for project owners well within its design. We sincerely believe that while assessment of GHG program is necessary by an accreditation entity for their implementation practices, a CORSIA & ICROA-level EUC criteria is enough to decide their minimum eligibility. | 0                                                                               |
| 162 | Anonymous            | Part 1: Introduction | ge              | Additionality:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                               |
| 162 | Anonymous            | Part 1: Introduction | ge              | Idea of pre-qualifying additionality of certain project activities and then letting GHG programs register projects does not work. CDM tried to develop global list of technologies, fuels and feedstocks to be listed under positive list, but with limited success. This is because the national and regional specificities make it impossible to develop global criteria on additionality. For example, renewable energy projects are not additional in one province/region/country but they can be additional in another. This proposal also interferes too much with decision making processes of GHG programs that use well-known methods to assess additionality.  | 0                                                                               |
| 162 | Anonymous            | Part 1: Introduction | ge              | Loft sided representation of geographies in ICVCM and decision power lies with few people:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                               |
| 162 | Anonymous            | Part 1: Introduction | ge              | Unfortunately, ICVCM team is crowded at all level with developed country representation. There is very little understanding of ground level circumstances of developing countries. For years GHG program have received the projects from developing world, which are very different from each other. We strongly believe that the existing ICVCM team, based on their limited understanding of developing countries, will create non-workable standards and protocols. There is too much of power within small group of people that will govern a potentially mega voluntary carbon market.                                                                              | 0                                                                               |
| 163 | Molly Brown          | Part 1: Introduction | ge              | In general, I agree that greater regulation of carbon registries ("carbon crediting programmes") is sensible. I am, however, concerned that ICVCM is creating an unnecessary additional level of bureaucracy and further reliance on a small pool of experts (most of whom are from the Global North). This will add to the cost of developing projects, without necessarily increasing the confidence of investors.                                                                                                                                                                                                                                                     | Limit the scope of the ICVCM to the regulation of registries, not credit types. |
| 163 | Molly Brown          | Part 1: Introduction | ge              | Is the problem in the carbon markets really that Verra and Gold Standard are not trusted / well-regulated? Or just the fact that offsetting AT ALL runs into accusations of greenwashing?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                               |
| 163 | Molly Brown          | Part 1: Introduction | ge              | I doubt that an extra level of scrutiny of credit types will actually squash 10 years of speculation about whether e.g. IFM stands up as a methodology. What can this expert panel add that hasn't already been discussed and debated? (Especially with limited resources, and huge pressure to vet all credit types quickly).                                                                                                                                                                                                                                                                                                                                           | 0                                                                               |
| 163 | Molly Brown          | Part 1: Introduction | ge              | I am also concerned about how the expert panel will avoid the many vested interests in getting certain types of credit approved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0                                                                               |
| 164 | Johan Börje          | Part 1: Introduction | ge              | In the absence of a location to make general introductory comments, Stockholm Exergi submits such comments here:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | -                                                                               |
| 164 | Johan Börje          | Part 1: Introduction | ge              | The IC-VCM work is an essential part of ensuring that the VCM can make a robust and decisive contribution to limiting global warming to 1.5 °C. In general, we support all the principles. They are all important and capture most of the key aspects of establishing a credible market for trade in carbon credits with high integrity.                                                                                                                                                                                                                                                                                                                                 | 0                                                                               |
| 164 | Johan Börje          | Part 1: Introduction | ge              | Stockholm Exergi is, of course, approaching the assessment of the principles from the perspective of its major endeavour to bring about what will possibly be the world's largest plant for negative emissions with geological storage in 2026.                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                               |
| 164 | Johan Börje          | Part 1: Introduction | ge              | As identified by IPCC AR6, "Carbon Dioxide Removal (CDR) is a necessary element to achieve net zero CO <sub>2</sub> and GHG emissions both globally and nationally, counterbalancing residual emissions from hard-to-transition sectors. It is a key element in scenarios likely to limit warming to 2 °C or lower by 2100 (robust evidence, high agreement)." (page 12-4). The expectation is that 2.75 Gtonnes of BECCS CDR will be required in 2050 (page 12-40).                                                                                                                                                                                                     | 0                                                                               |
| 164 | Johan Börje          | Part 1: Introduction | ge              | This is an enormous challenge, considering that no BECCS facility is operational and producing negative emissions in high quantities today.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                               |
| 164 | Johan Börje          | Part 1: Introduction | ge              | This has major implications for IC-VCM and similar initiatives. The rule book that is now in the process of being agreed on the VCM has to ensure that it facilitates the development of the required removals with geological storage deemed necessary by IPCC.                                                                                                                                                                                                                                                                                                                                                                                                         | 0                                                                               |

| 164 | Johan Börje                                                          | Part 1: Introduction | ge              | Against this background, it is important that the IC-VCM carefully considers the difference between traditional off-sets for compensation and the negative emissions with geological storage for neutralization of emissions. In case it is not feasible to find a common rule book for these two broad categories, it should be evaluated to have a separate “annex” which could more freely develop an integrity framework suitable for negative emissions with geological storage. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

In our view, CA should not be required for CCP-approved credits.                                                                                                                                                                                                                              | Risks do not apply when developing countries require additional finance to achieve their NDCs and the voluntary carbon projects concerned are indeed additional to what would otherwise happen.                                                                                                                                                                                                                                                      |
| 166 | Stephanie Sargeant                                                   | Part 1: Introduction | ge              | Risks do not apply when developing countries require additional finance to achieve their NDCs and the voluntary carbon projects concerned are indeed additional to what would otherwise happen.                                                                                                                                                                                                                                                                                       | Therefore, we believe that many developing countries, particularly those with conditional NDCs , should be granted a flexible approach, on the understanding that voluntary carbon markets are both a means for corporations to offset their interim or residual emissions and a meaningful contribution to host countries moving towards compliance with their NDCs.                                                                                |
| 166 | Stephanie Sargeant                                                   | Part 1: Introduction | ge              | Therefore, we believe that many developing countries, particularly those with conditional NDCs , should be granted a flexible approach, on the understanding that voluntary carbon markets are both a means for corporations to offset their interim or residual emissions and a meaningful contribution to host countries moving towards compliance with their NDCs.                                                                                                                 | This is subject to two caveats: First, the companies do not use the voluntary offsets for domestic compliance purposes and, second, the offsets do not feature in an NDC other than that of the host country nor towards stand-alone international commitments like CORSIA.                                                                                                                                                                          |
| 166 | Stephanie Sargeant                                                   | Part 1: Introduction | ge              | This is subject to two caveats: First, the companies do not use the voluntary offsets for domestic compliance purposes and, second, the offsets do not feature in an NDC other than that of the host country nor towards stand-alone international commitments like CORSIA.                                                                                                                                                                                                           | If this is the case, then there is no need to discount voluntary carbon credits from that country's (conditional) NDC through a Corresponding Adjustment, whether or not the investors (credit purchasers) claim them as part of their own net-zero strategy. Indeed, the investor could claim to deliver on a dual strategy, i.e., aiming at net-zero emissions at the company-level and at facilitating the host country to achieve its NDC target |
| 166 | Stephanie Sargeant                                                   | Part 1: Introduction | ge              | If this is the case, then there is no need to discount voluntary carbon credits from that country's (conditional) NDC through a Corresponding Adjustment, whether or not the investors (credit purchasers) claim them as part of their own net-zero strategy. Indeed, the investor could claim to deliver on a dual strategy, i.e., aiming at net-zero emissions at the company-level and at facilitating the host country to achieve its NDC target                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 168 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | Part 1: Introduction | ge              | Does not set a bar so high that it essentially excludes all existing schemes and therefore fails in its original intent and does nothing for the climate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 168 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | Part 1: Introduction | ge              | 3. The current ICVCM draft Assessment Framework defines high quality in a way that no project or jurisdictional REDD+ program currently meets or has any prospect of meeting in the near future. As such this creates an entirely new threshold for quality that goes beyond even the UN's ICAO framework and decisions on credits eligible for CORSIA in addition to the Paris Agreement itself.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 168 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | Part 1: Introduction | ge              | 4. Emergent has worked over the past 18 months to build the high integrity LEAF Coalition. The Coalition's members include 3 governments (Norway, UK and US) and over 20 corporations, representing buyers looking for high levels of integrity. Together they have committed \$1 billion in funding for jurisdictional REDD+ programs, sending a strong demand signal to forest nations that there is a market for high integrity credits. These companies and governments have already carried out extensive due diligence and made the informed decision that the ART-TREES standard represents high integrity. ICVCM requirements that go beyond ART-TREES and would render TREES Credits as non-CCP compliant sends the wrong message to the market, including forest countries and Indigenous Peoples. The ART-TREES requirements for measurement, monitoring, reporting and verification, safeguards and avoiding double counting are extremely rigorous and we cannot risk making it even more onerous and costly for these groups to participate in global carbon markets by making it even harder for countries, many of whom are already struggling to meet their NDCs. | 0               |
| 168 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | Part 1: Introduction | ge              | 5. The fact that no crediting programs or credits in the market today will meet the current proposed ICVCM threshold and therefore will not be deemed CCP-compliant will send a harmful signal to the marketplace and will cause buyers to stop investing in existing or forthcoming jurisdictional programs. Emergent's team has had literally hundreds of conversations with corporate sustainability officers over the past 18 months. We know that they and their boards are keenly aware of need for high integrity. But we also know that they, and particularly their boards, are extremely sensitive to the views of credible NGOs and organizations such as the ICVCM. CCPs and an assessment framework that put the bar out of reach will simply stop investment in its tracks.                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 168 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | Part 1: Introduction | ge              | 6. Forest countries will not be incentivized to continue to improve performance. Rather this may drive them to seek other ways to access finance via pathways with less stringent requirements or to simply define their own methodologies rather than continue crediting under reputable global GHG Programs such as ART. If this is the case, it could mean that the ICVCM ends up achieving the absolute opposite of its aims.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 168 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | Part 1: Introduction | ge              | 7. Forest countries have invested significant resources into improving their MRV and safeguards programs to meet requirements of bilateral agreements, REM, FCPF and now ART. Without significant private investment through access to markets, they will not have resources to achieve critical REDD+ results that are needed in the next decades to meet Paris Agreement targets. Governments must be able to demonstrate proof of concept to their constituents and see returns on the work currently underway before they introduce completely new requirements that will likely take multiple years to be implemented (if these new requirements are at all necessary or possible). Furthermore, benefit sharing agreements currently being negotiated must be implemented and stakeholders need to see benefits actually being shared before they are asked to do even more. If the ICVCM declares that no existing efforts meet their quality standard, national support for REDD+ and participating in high quality carbon markets will disappear.                                                                                                                         | 0               |
| 168 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | Part 1: Introduction | ge              | Recommendation: The ICVCM should build on requirements in existing high-quality REDD+ programs such as ART, recognizing that these standards have undergone significant stakeholder consultation and expert input and that jurisdictional REDD+ is different from project-based crediting. The jurisdictional approach already builds in higher levels of assurance against on issues like additionally, leakage and permanence. The recommendation of new requirements that go beyond current best practice should be backed up by a clear rationale and evidence of why they are needed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |

| 169 | Anonymous                                  | Part 1: Introduction | ge              | The ICVCM intention is to create a common standard to ensure quality of VCCs and confidence in the market. This intention of the ICVCM as a quality setter is supported, but only if the principles this is based on truly support, and not undermine markets. If done correctly, market participants should want to apply for accreditation.                                                                                                                                                                                                                                                                                                                                                                                                                                          | see above                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 169 | Anonymous                                  | Part 1: Introduction | ge              | The primary concern is the extent of the IC-VCM mandate which will require significant resources to conduct ongoing assurance processes. We question whether it is more fitting for these activities to be conducted by existing market participants (accreditation and verification bodies).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 169 | Anonymous                                  | Part 1: Introduction | ge              | In addition, we have concerns about the complaints and appeals procedure which should only apply to the direct work of the IC-VCM. Complaints and appeals about the standards should be handled by the standards' governance bodies (where IC-VCM could provide guidance on what adequate procedures look like).                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 170 | Anonymous                                  | Part 1: Introduction | te              | An underlying assumption of the CCPs is that carbon-crediting programs and standards operate at an appropriate scale. However, we see a huge gap in the VCM, particularly for smaller-scale projects. Their participation in the VCM is practically impossible due to costs and technical requirements. We believe this is a lost opportunity, since smaller-scale projects should have a place in the VCM                                                                                                                                                                                                                                                                                                                                                                             | We believe that "integrity" of the VCM requires the "integration" (inclusion) of ALL scales. To harness the full potential of the VCM we should leave no one behind. In this context, we suggest to the ICVCM to go beyond setting common guidelines for carbon-crediting programs and to highlight this as a major structural gap in the VCM. The VCM will not succeed by being exclusive. Integrity can only be based on inclusion. We trust the ICVCM to find ways to encourage carbon-crediting programs to develop this section of the market which carries a huge potential                                                                                                                                                                                                                                                                                                                                           |
| 171 | Anonymous                                  | Part 1: Introduction | te              | The document highlights the potential of the Global South for climate change mitigation through Nature-based Solutions (NbS). However, NbS are not a substitute for the rapid phase out of fossil fuels and should not delay urgent action to decarbonize the economy (Seddon et al. 2021).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | We believe this message should come across much more clearly and strongly in the CCPs, to avoid any risk that the VCM perpetuates levels of emissions, technologies, or carbon-intensive practices incompatible with the temperature goals of the Paris Agreement (San Jose Principles for High Ambition and Integrity in International Carbon Markets). Here we refer to locking-in levels of emissions, technologies, or carbon-intensive practices from the buyer's point of view, i.e. offsetting obsolete practices and technologies. Section 11 (page 113) says that "reaching net-zero by mid-century requires abandoning certain technologies much earlier than 2050". We propose this applies to buyers and sellers, i.e. the CCPs should not encourage offsetting of oil and gas. CCP-approved credits purchased by oil and gas companies must be immediately canceled and not used for offsetting nor brokerage. |
| 172 | Anonymous                                  | Part 1: Introduction | ge              | From our perspective, the IC-VCM's work is too narrowly focused on increasing buyer confidence and creating idealistic credits. As a result, an entire (and critical) component of a functioning market has been completely overlooked: the mechanics and realities of developing the projects that create the credits. The overall impact of the IC-VCM initiative—if implemented as proposed in an 'all or nothing' fashion—will be to stifle, interrupt, and cause irreparable damage to the VCM rather than scale it. In our view, the proposed measures will result in fewer projects due to significantly increased complexity, time, effort, risk of legal repercussions, and expense, creating conditions for a dysfunctional market: increased demand with little new supply. | The IC-VCM should consider taking a program approach where the assessment is limited to a review of existing programs. We also recommend taking lessons learned from the decades of experience of market participants and focus on making step change improvements and changes rather than rather than imposing sweeping wholesale changes to the market.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 173 | Individual/employee, Dorr Asset Management | Part 1: Introduction | ge              | Dorr Asset Management is a leading trader and market maker in environmental markets including voluntary carbon offsets as well as regulated carbon allowance markets trading across spot and derivatives markets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | To support IPLCs the focus will need to shift from carbon credits to biodiversity conservation and restoration as a separate mechanism. Biodiversity credits are a step in the right direction and are much more fundamentally aligned than carbon credits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 174 | Individual/employee, CLP Holdings Limited  | Part 1: Introduction | ge              | CLP Holdings Limited (CLP) welcomes the work of the Integrity Council for Voluntary Carbon Markets (IC-VCM) and supports its mandate to create core carbon principles (CCP) that will build integrity and scale voluntary carbon markets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 174 | Individual/employee, CLP Holdings Limited  | Part 1: Introduction | ge              | Voluntary carbon credits are essential to accelerating the net-zero transition by allocating private capital to tackle climate change. Therefore, we recognise that a robust and mutually assured oversight mechanism is needed to ensure standardisation in the market for high integrity credits in the absence of a regulatory body.                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 174 | Individual/employee, CLP Holdings Limited  | Part 1: Introduction | ge              | As a leading responsible energy provider in the Asia Pacific, with dual roles as a supplier and user of carbon credits, our feedback, with reference to specific sections from the consultation, is summarised below for your consideration:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 174 | Individual/employee, CLP Holdings Limited  | Part 1: Introduction | ge              | Initial Threshold                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Existing crediting programmes and active proponents will likely be unable to meet the rigour envisioned under the proposed CCP assessment framework and procedure. The monitoring and governance systems required to enforce the proposed criteria would require tremendous amounts of resources which could also potentially hinder CCP units from entering the market.                                                                                                                                                                        | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Therefore, CLP suggests a phased approach that starts with setting a threshold achievable by leading programmes within reasonable timeframes, such as those endorsed by the International Carbon Reduction and Offset Alliance (ICROA), and builds on their respective assessments.                                                                                                                                                                                                                                                             | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Mandate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | As the extent of the IC-VCM mandate may require significant resources to conduct ongoing assurance processes, it may be more fitting for assurance to be carried out by existing accreditation and verification bodies.                                                                                                                                                                                                                                                                                                                         | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Natural Climate Solutions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Natural climate solutions have a significant role to play in reaching net-zero, and they have seen rapid growth over the past years due to buyers' preference for the associated multiple co-benefits. However, many of the provisions in the Assessment Framework would not be attainable for such projects due to data and capacity constraints that would not be able to satisfy the prescriptive requirements under the CCP. This would likely result in projects originating from natural carbon sinks not being eligible for CCP credits. | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Additionality                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | CLP welcomes the use of financial additionality tests to fast-track the assessment of credits with high likelihood of financial additionality. This is to determine the quality and credibility of such credits being generated from projects that are truly creating additional greenhouse gas reduction or removal. However, this should not lead to automatic exclusion of credits, and those with low or medium likelihood should be subject to additional assessment criteria instead.                                                     | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | The current proposed assessments are also highly project-specific, so clarity is also needed to define what constitutes an activity or project type that would fall under these additionality assessments.                                                                                                                                                                                                                                                                                                                                      | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Permanence                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | CLP would recommend that focus should be placed on the overall approach of programmes in addressing non-permanence to avoid excluding entire sectors based on project type assessments. Provisions should also be in place to assess the risk of non-permanence and how they are managed in the long-term. Labelling of credits according to the number of years of permanence assured by programmes should also be considered.                                                                                                                 | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Robust Quantification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Focus should be placed on high-level requirements for methodology development, assessment and update, rather than on individual quantification methodologies. Given the complexity of individual assessment methodologies it may not be practical for IC-VCM to be vetting each one of them, but instead the Integrity Council should focus on assessors, accreditation and verification bodies to ensure they are trained appropriately and follow high-level requirements with integrity.                                                     | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | Attributes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 174 | Individual/employee, CLP Holdings Limited | Part 1: Introduction | ge              | CLP supports the universal labelling of credits indicating the type of mitigation activity and would suggest including the distinction of natural and technological solutions for both reductions and removals. CLP also supports the labelling of adaptation benefits of credits and the inclusion of quantified Sustainable Development Impacts as an attribute rather than a requirement for the initial threshold.                                                                                                                          | 0               |

| 175 | Anonymous                                 | Part 1: Introduction | ge              | Since there are a number of related risks for the type of mitigation activity (non-permanence etc.), we believe that it would be ideal if the risks were listed by hierarchy or order of significance, rather than simply tagging the risks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 176 | Thales West                               | Part 1: Introduction | te              | As stated in page two of the document, the "purpose of the draft Core Carbon Principles (CCPs) and Assessment Framework is to provide a credible, rigorous, and readily accessible means of identifying high-quality carbon credits that create real, additional and verifiable climate impact with high environmental and social integrity." Such a framework is undoubtedly much needed, but not easily developed. Proper assessments of integrity or additionality are intrinsically linked to baseline design, a highly technical matter. The current draft is not technical and thus falls short of its purpose. Furthermore, the proposed framework is mostly derivative of other already existing documents, such as the VCS and the ART-TREE standards, without significant contribution to carbon offset/REDD+ discussions or novelty.                                          | N/A             |
| 176 | Thales West                               | Part 1: Introduction | te              | Specifically, the document does not address the most fundamental problem with REDD+ baselines: the technical challenge of constructing credible counterfactuals that can be used to rigorously measure the effectiveness of the REDD+ activities at reducing deforestation and forest degradation and, consequently, the additionality of their carbon offsets. In other words, how to ensure that each carbon credit issued unequivocally represents (at least) one ton of carbon dioxide that is not emitted to the atmosphere due to the REDD+ activities. Without a sound technical component, the Assessment Framework is unlikely to "provide a credible, rigorous, and readily accessible means of identifying high-quality carbon credits that create real, additional and verifiable climate impact with high environmental and social integrity," thus failing at its purpose. | 0               |
| 176 | Thales West                               | Part 1: Introduction | te              | Furthermore, any "real" challenges regarding additionality/baseline assessments are addressed by vague, subjective statements. It is unclear, for instance, how the quantification of the "uncertainty inherent in assessing the likely baseline scenario and likely baseline emissions or removals" shall be performed (Criterion 10.2, Step a) as well as of the "degree of conservativeness" (Criterion 10.2, Step b). The text seems to overlook the subjectiveness inherent to such assessments and its implications for their outcomes. Technical guidance to (at least) mitigate the issue of subjective assessments is missing and should be provided by a technical panel of experts.                                                                                                                                                                                           | 0               |
| 177 | Anonymous                                 | Part 1: Introduction | ge              | Thank you very much for the opportunity to react on the draft Core Carbon Principles (CCPs), Assessment framework and Assessment procedure. We are also very grateful to the board of the Integrity Council for the Voluntary Carbon Market for your enormous efforts to help scale the voluntary carbon markets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | -               |
| 177 | Anonymous                                 | Part 1: Introduction | ge              | In this response on behalf of XXX, we first share some general observations and then make some detailed comments per section (1 to 6). Our general observations have to do with sometimes overshooting in terms of theoretical quality criteria, towards a set of more workable CCPs and procedures and with the need for a set of CCPs that also fit nature-based solutions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 177 | Anonymous                                 | Part 1: Introduction | ge              | We did not seek to cover all of our questions and comments. There are more legal questions and comments, but rather than listing these at this stage, we think it would be more efficient if we (particularly our Legal Department) could raise these in a (possibly general) Q&A session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |

| 177 | Anonymous            | Part 1: Introduction | ge              | Will the draft CCPs, assessment framework and procedure help to accelerate the scaling of the voluntary carbon market? In doing so, the ICVCM must balance on a thin rope. It is a balance with on the one hand maximizing quality requirements to ensure support from as many environmental and scientific groups as possible and on the other hand generating a set of workable and implementable principles that are not too detailed (principle versus rules based). We think the current documents may be a little bit out of balance to the first part: maximizing quality requirements. It might be better to further optimize the quality of requirements.                                                                       | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | The intention is growth of the voluntary carbon credit market without compromising on integrity. However, we believe the costs related to maintain a certain level of integrity may negatively impact growth of the market: if administrative costs, research, data gathering etc. ('production costs') rise, pricing of voluntary carbon credits in the market will also rise. We flag two possible results of high costs: carbon crediting programs may cut in the revenues to Partners in order to cover costs, and buyers may buy smaller amounts of voluntary carbon credits when the pricing is too high (possibly resulting in stagnating market growth). So here we flag a tension between 'integrity', market growth and costs. | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | Of course, not to disrespect the importance of high quality but to give requirements more practical meaning, so that the roll-out of carbon project and its funding can actually speed up. Now, the requirements may be so detailed and so far removed from today's practice that they may even hamper scaling up. Of course, high quality is very important but if building an ideal world keeps us from taking steps in the real world, then we need to lower the bar a little. Let the ideal not stand in the way of a better world. Or in the words of Montesquieu 'Le mieux est l'ennemi mortel du bien' ('the best is the mortal enemy of the good').                                                                              | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | Some observation to further explain what we mean with the above general observation:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | 1) The documents, particularly Part 4, are very extensive and it will take very substantial efforts, time and costs to deal with all requirements, including updates. Hopefully this does not become prohibitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | 2) In order to lighten the burden, reduce costs and to achieve more consistency across programs, it could be considered to develop templates (possibly differentiated per type of mitigation activity), containing standard language to cope with -inter alia- the requirement to have certain procedures, requirements etc in place. These could be included in the program "by reference".                                                                                                                                                                                                                                                                                                                                             | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | 3) It is positive that ICVCM states that a "risk based approach" is taken. However, when going through the documents there are many mandatory requirements and there seems little room to deviate based on substantiated non-applicability or immateriality. This particularly applies to Section 7 of Part 4: Sustainable Development Impacts and Safeguards. This also applies to table 36 – Requirements for Criterion 7.11: Access and benefit sharing. One could imagine that a more risk based approach would be applied and this only applies in case of "sensitive" circumstances. Programs with large farmers for example should not fall within this scope.                                                                    | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | 4) Part 4, Section 3: Robust Independent Third-Party Validation and Verification. It seems that the CCP requirements sets rules for the engagement and instructions of the VVB, whilst it can be expected that the VVB itself deals with the topics referred to and will determine the requirements. There seems a risk of overlap and inefficiency. Accredited VVBs should incorporate relevant CCP rules in their protocols, so this risk will be mitigated.                                                                                                                                                                                                                                                                           | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | 5) Unsolicited assessments of programs: if ICVCM becomes the market standard, it is doubtful whether that has a real added value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | 6) It is quite remarkable that there is no language dealing with the validity/tenor of carbon credits. Would it be a good idea to have old credits floating around while standards have substantially moved upwards? Would retirement within a certain time frame (possibly dependent on the quality of the credit) not be logical?                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | Towards a set of CCPs that also fit nature-based solutions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |

| 177 | Anonymous            | Part 1: Introduction | ge              | We would recommend building more flexibility into the CCPs and procedures to also give space to carbon solutions that are still under development but have huge potential to reduce climate change. The current set of CCPs and the procedures seem to be drafted based on proven technology based solutions and planting trees/forests and REDD+ projects. Carbon farming seems to be out of scope in this draft. To show that (scaling up) our projects are therefore not helped by the drafts at hand, we provide an explanation of the XXX below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | We see the impact that climate change has on our clients and we feel the urgency to make a system change happen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | We have looked at your public consultation documents from this perspective of the need of providing high-quality carbon solutions resulting in enhanced soil health and nutritional value focused on improving sustainability for agri-food supply chains. We see carbon credits just a means. The ultimate goal of XXX is to have more sustainable agriculture. Carbon credits can help in the transition because they put a price on the ecosystem services delivered by farmers and by doing so giving them an extra income to make the transition to sustainable food production.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | Let me be clear: prevention and reduction would be the preferred strategy for every corporate. Unfortunately, in everyday practice, not all emissions can be reduced to zero. For the emissions that are not yet avoidable, offsetting with high quality removal credits is a good option. If we were to wait until all emissions could be reduced, we would lose valuable time. We cannot afford that when it comes to fighting climate change! Furthermore nature based carbon credits are about more than removal. What makes carbon farming so powerful is that it not only removes GHG from the atmosphere, but also reduces emissions into the atmosphere. By using regenerative farming practices soil will be healthier because the biodiversity is improved and is then able to absorb more carbon. That will have co-benefits in terms of more water resilience, reducing pollution by minimizing erosion and nutrient runoff, purifying surface and groundwater, increasing nutritious value of crops, and possibly enhancing crop production. | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | Although soil sequestration has many co-benefits, it may not fulfill the CCP-requirement of permanence defined in a strict way. This may therefore be an impediment to scaling the nature based carbon credits market. We propose to take a broader view and also include the co-benefits and a more pragmatic definition of permanence depending on the (im)possibilities of the project (including co-benefits). Permanence may become better feasible when a reward system for keeping carbon stored in soils is developed next to the reward system based on carbon credits for storing extra carbon. Rewarding farmers that are already following the regenerative agriculture pathway and developing a sustainable agriculture will help prevent carbon losses and maintaining current carbon stocks. That is just as important as the influx of extra carbon in soils.                                                                                                                                                                             | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | Besides permanence more flexibility is also required when it comes to additionality, and allow closer cooperation between private and public parties on carbon farming, without jeopardising the additionality of the credits. Governments investing in carbon farming projects make it difficult for private parties to guarantee additionality, which is necessary to realise high integrity credit on the voluntary carbon market. Governments that invest in soil sequestration out of good intentions might then discourage the private sector from also investing in soil sequestration. It is important to enable private-public co-investment instead of crowding out private initiative.                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 177 | Anonymous            | Part 1: Introduction | ge              | Also it is unclear why there is more flexibility created for additionality of tropical forest protection, or JREDD, and not for other nature based carbon solutions (part 1, p. 14)?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |

| 178 | Anonymous                                  | Part 1: Introduction | ge              | Stakeholders. For clarity purposes, please also provide a list of all parties/stakeholders involved in the voluntary carbon credit market and their (separate or combined) roles under the Framework. This to clarify that different roles may be in one party or in different parties. As we understand it a mitigation activity proponent, a carbon-crediting program, the program registry and even a user, can be, but not necessarily have to be, within one and the same entity. These can be separate entities.                                                                                                                                                                                                                                                                                                                                                        | 0               |

| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | Respira International is a carbon finance business and active participant in the VCM. We are submitting our comments at a high level here rather than line by line. We are splitting this in to 1) General comments and 2) comments related to specific elements of the CCPs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | N/A             |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | General comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · We support the CCP process, believe that integrity is crucial and think that it needs to work to build wider trust in order for the market to scale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · However, as currently drafted it is not practical. Very few (if any) existing credits would meet all the CCP criteria and it will create significant backlogs whilst existing programs and projects scramble to meet any new criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · We agree with the majority of the specific and detailed suggestions as proposed by the IETA working group – so are keeping our comments at a higher level and focussed on some specific ideas we have.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · We think there needs to be a clear and tangible incentive to achieving CCP status to bring the project developers and certification programs on board. This could, for instance, be in the form of an advance market commitment (at a premium to current VCM prices) through a collection of buyers, or through the acceptance of CCP credits into more global carbon compliance programs or the recognition under carbon accounting standards. If this could be demonstrated, we think it would significantly change mindsets and levels of buy in.                                                                                                                                                                                                                                                                                                                        | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · Due to the combination of lack of a tangible incentive and the impractical requirements to achieve CCP status currently, we think there is a significant danger that no programs apply to receive CCP status. This would have very negative consequences for trust in the sector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | Specific comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · We think that more credence should be given to existing certification bodies and their ability to enforce CCPs. Rather than IC VCM reviewing every single 'credit type', focussing the analysis more on whether existing programs (eg Verra, Gold Standard, ACR, CAR etc) had the ability to implement CCPs would be a more practical approach. This would inevitably result in some methodologies being adjusted or even discontinued in order for the standard to stay compliant at the program level, but ultimately this would empower the existing bodies (who have significant in house technical expertise) and build broader trust in these standards.                                                                                                                                                                                                              | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · Assessing credit types by the black and white 'CCP' vs no 'CCP' is inherently challenging as there are so many shades of grey. In this respect, we see the risk weighted approach being employed by some of the new carbon credit rating agencies as more helpful to assess quality on a project level. The job of CCPs would be to essentially certify programs, then the ratings agencies can assess varying levels of risk associated with individual projects. The market is then free to decide whether it values this information or not. Where repeat issues have been identified in respect of a specific project type or methodology (for example, the additionality of legacy renewable energy projects), the IC VCM could ensure that appropriate scrutiny is brought to bear and that requisite changes are implemented by the standards to maintain integrity. | 0               |

| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · We think that a large amount of the distrust of existing certification bodies is due to poor communication. It is incredibly difficult for a non expert to read through a PDD, verification document etc and quickly understand how a project is addressing aspects such as additionality, permanence, leakage etc . One of the simplest and most helpful roles IC VCM could play would be to simply require all certification bodies to summarise how each project adheres to each of CCPs 1-4, and 8-10 on the registry's website.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · On safeguarding, we think basic adherence to IFC performance standards is reasonable. The issue is how practical this is. It's no easy task and practically would be beyond the capabilities of most smaller developers. Imposing these in full could stifle or delay the implementation of critical mitigation activities. Rather we would propose a streamlined version of the IPC Performance Standards where necessary to extend the scope of the existing carbon standard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · On additionality – we agree that this is currently not well explained in existing project documentation and not consistently applied. We see that the interpretation of additionality needs to be determined in the specific context of the project and not writ large across all project types, methodologies, or standards. Evidently this will vary widely between such diverse project activities as renewable energy, avoided deforestation (in at risk areas, as well as for instance High Forest Low Deforestation (“HFLD”) countries), carbon capture storage and soil carbon sequestration from regenerative farming methods. A standardised, one size fits all approach to additionality does not square with this and will not be operable. We do not believe that the IC VCM need to rewrite any rules on additionality but that, given the centrality of this to the VCM and complexity, it should be a focus area for the standards and the IC VCM going forwards to develop clearer rules at the project type level. We also think that conducting IRR tests on ‘project type’ will be almost impossible as IRR calculations are very project specific. | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · On permanence – we have concerns about applying blanket requirements for different project types. Similar to the previous point, trying to argue that a soil credit has the same level of permanence as a DACs (geological storage) credit is always going to invite criticism. Instead, we suggest a new framework could be introduced whereby each certification body is required to report a number of ‘years of permanence’ associated with a particular credit type/methodology. This should then be clearly tagged and communicated, and ideally fed into the VCMI process to help with consistent claiming. We anticipate that such transparency could help create a level playing field and encourage participants in the market to develop solutions to increase the durability of less permanent interventions, such as NBS projects, via the application of, for example, long-term governance structures, or the application of insurance.                                                                                                                                                                                                                 | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · On Paris alignment – we think there needs to be a simple message. If a company wants to make a voluntary claim, no CA is required. However, a CA is required if the credit will be used for compliance purposes by a company in another country, or it is purchased by a sovereign nation to meet their own NDC requirement. In all cases, we believe that carbon credits should be ‘authorised’ by a country, but this is different to whether they require a CA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 179 | Individual/employee, Respira International | Part 1: Introduction | ge              | · On tagging – we think that key elements such as avoidance vs removal and whether it comes with a CA or not should be tagged. This needs to then directly link to the VCMI's claims work. Other project elements (such as whether it is a nature or technological project and relevant SDGs should be made clear in project documentation, but do not need to be explicitly tagged as they are not relevant for claims but are rather an underlying attribute)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 180 | Molly Brown                                | Part 1: Introduction | ge              | While we welcome the move towards greater scrutiny in theory, we have some general remarks on the IC VCM:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | ...             |
| 180 | Molly Brown                                | Part 1: Introduction | ge              | · First, we see a conflict of interest if not all carbon registries / standards are represented on the council. We are also concerned by the lack of project developer / proponent representation in the decision-making processes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 180 | Molly Brown                                | Part 1: Introduction | ge              | · Second, we see potential contradictions of the evolving principles and the assessment framework with domestic GHG programmes using voluntary carbon credits                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 180 | Molly Brown                                | Part 1: Introduction | ge              | · Third, we are concerned that compliance with the Assessment Framework creates an unnecessary additional level of bureaucracy, further reliance on a small pool of experts (most of whom are from the Global North), and an additional financial burden for those who do the work on the ground – the project developers                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |

| 181 | Anonymous                         | Part 1: Introduction | ge              | XXX commends the Integrity Council for the Voluntary Carbon Market on the rigorous and inclusive process to develop these core carbon principles and the associated assessment framework and procedure. We share the view that the, as they continue to evolve, Voluntary Carbon Markets can assist in the transition toward achieving the climate goals set by international policymakers. Further, we have extensive experience developing futures products utilizing existing market-based offset solutions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | N/A             |
| 181 | Anonymous                         | Part 1: Introduction | ge              | XXX is a strong proponent of market-based solutions and has been in the forefront of launching voluntary carbon-based futures contract. In 2021, XXX launched its XXXX futures contract in conjunction with spot market operator CBL, an XXXX, which is a market-based solution that sets its foundation in an international framework and is designed to harmonize the buying and selling of offsets from registries and emission reduction projects across the world. Developed and adopted by the International Civil Aviation Organization (“ICAO”), CORSIA is a globally accepted carbon offset and reduction scheme. As the Task Force acknowledges below, CORSIA’s stringent screening process can be used as a guide for organizations across industries when sourcing emissions offsets. The spot GEO contract sets its foundation in the rigorous selection criteria and review process developed by ICAO and a group of carbon experts from 19 countries known as the Technical Advisory Body (“TAB”). One of the primary goals of the emissions unit criteria is to ensure that offsets under CORSIA result in genuine or additional greenhouse gas (“GHG”) emissions reduction. CORSIA-eligible voluntary carbon offset credits for the GEO futures contract will be eligible from selected registries. | 0               |
| 181 | Anonymous                         | Part 1: Introduction | ge              | XXX designed to lead to a more efficient and transparent market for Agriculture, Forestry and Other Land Use (“AFOLU”) sector credits, well as the CBL Core Global Emissions Offset (“C-GEO”) futures contract. The XXXX follows the industry-leading Verified Carbon Standard (“VCS”) and require additional certification of Verra Registry’s stringent Climate Community and Biodiversity (“CCB”) Standard. XXXXX are intended to align with the draft Core Carbon Principles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 181 | Anonymous                         | Part 1: Introduction | ge              | As the Integrity Council finalizes its CCP assessment framework and procedure, XXX agrees that, properly executed, a principles-based standardized benchmark could further pave the way for core carbon futures driving a transparent price signal and better risk management. Further, healthy price discovery in traded markets and a visible and transparent forward curve will be essential tools for further market growth, and as a result, an accelerated transition to the goals shared by the Integrity Council, the Task Force for Scaling Voluntary Carbon Markets and international policy makers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 182 | Individual/employee, Agreeena ApS | Part 1: Introduction | ge              | Agreeena ApS ( <a href="https://agreeena.com/">https://agreeena.com/</a> ) welcomes the opportunity to respond to the Integrity Council for the Voluntary Carbon Market’s public consultation on the Core Carbon Principles (CCPs) and Assessment Framework.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | N/A             |
| 182 | Individual/employee, Agreeena ApS | Part 1: Introduction | ge              | We are providing feedback for this public consultation as an active player in the voluntary carbon market. As Agreeena has developed a carbon payment program focused on increasing agricultural soil organic carbon stocks, the attention to new developments and staying ahead of the regulatory field is fundamental to maintaining strong environmental integrity within our programme. Agreeena is in alignment with the IC-VCM’s mission to ensure the Voluntary Carbon Market (VCM) accelerates a just transition to 1.5 °C, the generation of high-quality carbon credits and advocates for activities that aim to ensure the quality of credits generated by different types of projects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 182 | Individual/employee, Agreeena ApS | Part 1: Introduction | ge              | We would first and foremost like to express our support and ability to contribute to all work aiming to develop the VCM that can provide a framework and establish consistency as this market continues to expand exponentially. To frame our response, we are approaching the CCPs in the context of nature-based solutions that are financing farmers’ transition to regenerative agriculture.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |

| 182 | Individual/employee, Agreea ApS | Part 1: Introduction | ge              | Agreea has developed its threshold for environmental integrity in alignment with existing globally recognized standards, and we are glad to see that the CCP framework is doing the same. To ensure full operationalization, we hope that the CCPs will be able to work in cooperation with the existing global VCM standards and will not generate any bottlenecks for existing and future projects in the market. The VCM and carbon removals that will ensue from the market will be necessary to meet global climate targets. Public and private funding should work in conjunction to advance the VCM and to provide support to accelerating nature-based solutions. Agreea has played an active role in the participation of this consultation process as it has been unfolding, and attended the CCP deep-dive sessions during the week of 12-16 September. We appreciate the Integrity Council for providing a detailed look into the integral elements of the CCPs that were covered in the material that is subject for consultation. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 183 | Anonymous                       | Part 1: Introduction | te              | I am an academic researcher affiliated with Lawrence Berkeley National Laboratory and the University of California, Berkeley working with an international multidisciplinary group of offset quality researchers in a thorough review of REDD+ methodologies with the Berkeley Carbon Trading Project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <ul style="list-style-type: none"> <li>The CCP assessment framework should not be weakened; the CCP stamp should be reserved for credits that are conservatively not over-credited and confidently not associated with harm. For the CCPs to have a strong influence to create a quality market, the CCP stamp must be trusted by buyers, and this will encourage registries to amend their protocols to receive the stamp.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 183 | Anonymous                       | Part 1: Introduction | te              | Overall, the CCP framework could overcome the challenges of complexity, uncertainty, opacity, and interest, but a few fundamental changes (listed below) are needed to the proposed approach. The framework needs to be strengthened, not weakened, to reasonably ensure that project types that receive the stamp are not over-credited. The CCPs should be reserved for credits that are conservatively not over-credited and confidently not associated with harm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <ul style="list-style-type: none"> <li>Weak conservativeness. In its present form, the CCP framework has vague conservativeness and is loose. While the framework states its aim for conservativeness, the information provided is very vague because it is not followed by a very clear step-by-step explanation on how to assess conservativeness and the best possible use of the appropriate scientific sources of information. Including the word “conservative” is not enough to guarantee actual conservativeness.</li> </ul>                                                                                                                                                                                                                                                                                                                                   |

In the “Mitigation activity information” (page 19) section of the report, it is stated that “The carbon-crediting program shall provide comprehensive and transparent information on all credited mitigation activities. The information shall be publicly available in electronic format, and scrutiny of mitigation activities shall be accessible to non-specialized audiences.” I agree this is very important and not yet a common practice. In my current review of VCS REDD+ methodologies, I realized that project data and information is not similarly available on the registry’s webpage. For instance, I can not find the original forest survey data, which prevents stakeholders and third parties to test whether the project’s carbon accounting is robust.</li> </ul> |

| 183 | Anonymous                                       | Part 1: Introduction | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | · “c) The carbon-crediting program shall have provisions for the rotation of VVBs in carrying out validations and verifications. Justified exceptions may exist.” This seems very vague because it is not well explained in what circumstances could exceptions be made.                                                                                                                                                                                                                                           |
| 183 | Anonymous                                       | Part 1: Introduction | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | · Quality matters. Issues with vagueness in details. The assessment framework lists key requirements such as those in Table 12 but fails to provide the details necessary to avoid vagueness and the resulting confusion due to misinterpretation. For instance, the requirements listed in Table 12 (page 57) make sense but are still vague. It is necessary to ensure that the CCP stamp is reserved for projects that do not over-credit. This is not yet possible with the current version of this framework. |
| 183 | Anonymous                                       | Part 1: Introduction | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | · Accounting and monitoring are not yet robust. The assessment framework is not specific about how “the choice of the approaches, data, measurement methods or default values appropriately addresses uncertainty and leads to a conservative estimate of the emission reductions or removals” can be accomplished. Data sources related to carbon accounting must be narrowed down.                                                                                                                               |
| 183 | Anonymous                                       | Part 1: Introduction | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | o The CCP framework does not add anything different from what is already included in project-based REDD+ methodologies. I suggest more specific information to clarify what “scientifically sound” means, for instance. It is important to provide specific details to avoid terms like “where applicable”, which leaves much room for exceptions to the items listed in the assessment framework.                                                                                                                 |
| 183 | Anonymous                                       | Part 1: Introduction | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | o The uncertainty level must be reviewed. Given all the limitations to accurately estimating carbon stocks in natural ecosystems that are typically included in REDD+ methodologies, an uncertainty level of 10% may not be conservative enough.                                                                                                                                                                                                                                                                   |
| 184 | Individual/employee, Conservation International | Part 1: Introduction | ge              | RE “based on solid science”: Private sector feedback is that there is nothing to back the accuracy of the science and seems to be more policy oriented. Scientists need to disclose their biases and who is funding them as well.                                                                                                                                                                                                                                                                                                                                                                                         | Confirm accuracy of science that IC-VCM is basing things on. Scientists involved need to disclose any biases and who is funding them.                                                                                                                                                                                                                                                                                                                                                                              |
| 185 | Individual/employee, Conservation International | Part 1: Introduction | ge              | RE “assessing crediting programs and credit types against that benchmark; and clearly identifying those that meet it”: quality is driven by quality of underlying projects. Painting all projects or credit types with the same brush is unrealistic as project details and context matter. At a more general level, assessing what criteria carbon standards use makes sense, but still quality is determined at the individual project level context. Even for jurisdictional programs implementation quality will be a driver of quality, standards requirements aside.                                                | Recognize that projects and programs are very contextual. The quality criteria should be applied within those project contexts and not paint every project with the same brush, might include things that are not relevant.                                                                                                                                                                                                                                                                                        |
| 186 | Individual/employee, Conservation International | Part 1: Introduction | ge              | RE “By creating a standardised benchmark...” : Assumes CCP principles will create “transparent” prices. For the current OTCspot market, regardless of CCPs, this is difficult. In financial markets, price transparency comes when financial securities are publicly traded and prices are available on broker screens. Transparency of prices will be easier to get once market develops needed size, liquidity, and depth. Feedback from many market players is that markets automatically price and differentiate with floating prices once more volume is traded and there is a benchmark against which assets trade. | Align pricing data transparency approach with what is realistic for how markets work.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 187 | Anonymous                                       | Part 1: Introduction | ge              | *                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | No concrete change proposed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 187 | Anonymous                                       | Part 1: Introduction | ge              | XXXXX is a voluntary study group mainly from the energy industry and energy-intensive industries, started in January 2020 and attended by 140 companies and organizations. At the study group, voluntary members exchanged views on the IC VCM consultation paper. Comments are not a unified view of the study group, but a compilation of opinions from each participant, some of which are divided.                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 187 | Anonymous                                       | Part 1: Introduction | ge              | A) CCP as a whole is comprehensive and covers many important aspects. However, level of threshold in the assessment is too high, and it may take time before credits are supplied that meet the required level. IC VCM aims to accelerate climate change action through the use of voluntary market. However, this could lead to discourage reduction investment.                                                                                                                                                                                                                                                         | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 187 | Anonymous                                       | Part 1: Introduction | ge              | B) CCP requirements look to assume credits when net-zero is achieved. If so, it should be explicitly stated that the credits are to be used at net-zero and not for transition. Or, requirements should be revised to cover for the time of transition up to net-zero.                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 187 | Anonymous                                       | Part 1: Introduction | ge              | C) Voluntary credits have pioneered new frontier. While they are not CCP-eligible, these may contribute to climate change mitigation measures. These are not “low quality credits”. Such initiatives should not be excluded.                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 187 | Anonymous                                       | Part 1: Introduction | ge              | D) IC VCM should ask crediting-programs if this works well. Also IC VCM should also reflect the views of project developers and credit buyers whether this will scale up voluntary market for Paris Goal.                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 188 | robert stevens       | Part 1: Introduction | ge              | Climate Impact Partners was formed in 2021 from the merger of Natural Capital Partners and ClimateCare. We are built on the expertise, integrity, and innovation of two companies that have led the voluntary carbon market since 1997. We are a profit for purpose B Corp, with a long track record of developing and delivering the highest quality carbon-financed projects. We work with over 500 leading corporates, NGOs and governments to deliver climate impact, ensuring they meet their carbon neutral, net zero and NDC goals.                                                                                                                                                                                                                                                                                                                                         | n/a             |
| 188 | robert stevens       | Part 1: Introduction | ge              | We are founder members of ICROA, which has driven quality and integrity in the VCM over the past 15 years, and are board members of IETA. In this context, we have participated in developing the combined ICROA and IETA response to the IC-VCM consultation and our views on the technical aspects of the draft AF and CCPs are reflected in that submission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 188 | robert stevens       | Part 1: Introduction | ge              | In addition to the ICROA/IETA submission, we want to submit general comments and recommendations in response to your call for feedback on the draft IC-VCM documentation. We have submitted all our comments in this 'Introduction' section                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 188 | robert stevens       | Part 1: Introduction | ge              | · We support the objective of the IC-VCM to bring increased trust and integrity to the VCM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 188 | robert stevens       | Part 1: Introduction | ge              | · We believe that the commoditised and off-exchange sectors of the voluntary market will complement each other in serving the full spectrum of corporate needs. The commoditised market will provide high integrity credits at lowest cost for big emitters; and the off-exchange market will continue to provide high impact credits valued by corporates which require greater involvement in and identification with projects that deliver impact beyond climate. Our view is that the IC-VCM can play an important market role in maintaining and strengthening market integrity by focusing on governance and continued improvement. Starting with where the market is now, leveraging existing initiatives such as the ICROA and ICAO assessment frameworks, and overseeing processes to drive improvement and strengthen hot-spot areas identified through the consultation | 0               |
| 188 | robert stevens       | Part 1: Introduction | ge              | · However, the documents as they are written do not build on current best practice. We support the draft CCPs but have serious concerns about how these principles are proposed to be assessed through the Assessment Framework (AF). The AF as it is written imposes an additional layer of monitoring and verification systems that would be both costly and time intensive to set up to assess every credit type, with impractical timescales. Applying the framework will create a bottleneck in the voluntary market at a time when it is key to accelerate climate action.                                                                                                                                                                                                                                                                                                   | 0               |
| 188 | robert stevens       | Part 1: Introduction | ge              | · In particular, the framework as it is written is choosing a narrow set of acceptable solutions for reductions rather than incorporating the widest possible scope of activities that can be implemented – all of which are necessary if we are going to keep temperature increases below 1.5 degrees: Specifically, the framework will essentially exclude the majority of natural climate solutions credits in the market. Climate Impact Partners urges the IC-VCM to recognize the significant biophysical potential of nature in combatting climate change and furthering adaptation.                                                                                                                                                                                                                                                                                        | 0               |
| 188 | robert stevens       | Part 1: Introduction | ge              | · It is in the whole market's interest to have a high quality, high integrity framework to build trust. One of the unintended outcomes we must avoid is that crediting programmes and active proponents may not apply for CCP assessment if they believe that approval is unattainable and/or will cause a bottleneck in the market, without improving quality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 188 | robert stevens       | Part 1: Introduction | ge              | · We have been encouraged by the level of engagement that IC-VCM has demonstrated with IETA during this consultation period and believe that the process will deliver a practical, high integrity framework which will support the scaling of climate action that society needs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |

| 189 | Carolyn Ching        | Part 1: Introduction | ge              | Ceres applauds the Integrity Council for Voluntary Carbon Market's hard work in convening and gathering diverse perspectives to develop the Core Carbon Principles and Assessment Framework to achieve a high integrity carbon market. ICVCM has a pertinent role to play in affirming the integrity in the carbon market and making it easier for buyers to identify high-quality carbon credits. Companies are regularly criticized in the media for their carbon purchases and consequently are seeking guidance on how to identify high-quality credits. However, ICVCM must ensure this new criteria and process does not create uncertainty in the market and slow corporate demand for credits. Today, none of the GHG crediting programs meet all the requirements of the CCP outlined in ICVCM's Assessment Framework. The level of stringency expected will require time to implement and could make many existing projects ineligible. Companies may face criticism for purchasing carbon credits prior to CCP, or in the future for having purchased credits from projects that are unable to achieve CCP. ICVCM set out to help grow the carbon market, however, the criteria as they are written today will likely have the opposite effect. We must not slow down climate financing during this critical decade for climate action. | In order to avoid a chilling effect on the market, we recommend that ICVCM calibrate the initial criteria such that the high-quality carbon credits that exist today would be CCP eligible immediately. If necessary, the ICVCM can add additional criteria overtime, while creating a pathway for projects to move forward with CCP eligibility. |

| 190 | Anonymous            | Part 1: Introduction | ge              | XXXX is an environmental NGO with a long-established programme of work and expertise in developing nature-based solutions to climate change, including projects for the voluntary carbon market. We have extensive international experience in the development of REDD+ projects and programmes. XXXX is active across land and seascapes in over 40 countries, with well over 150 active conservation projects, working with local partners, communities and governments to drive positive impacts for climate, biodiversity and people.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                 |
| 190 | Anonymous            | Part 1: Introduction | ge              | XXXX is supportive of the need to accelerate and scale the carbon markets in order to drive climate ambition and impact, building demand and, critically, ensuring high quality and integrity of both carbon credits and governance of the market. XXXX has contributed to the IC-VCM public consultation process, and has also contributed to the Natural Climate Solutions Alliance formal response as a member of the steering committee. Below, we set out a number of additional concerns we consider important to feed into this public consultation process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                 |
| 190 | Anonymous            | Part 1: Introduction | ge              | Overlay broad approach to carbon and activity types                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                 |
| 190 | Anonymous            | Part 1: Introduction | ge              | XXX identified concerns during the earlier rounds of the consultation process, specifically with the very broad approach taken by the IC-VCM to include all programmes, carbon typologies and project activities within one container. These concerns are due to a lack of acknowledgement of the differences in mitigation activity across the VCM as a whole, raising the question whether the same exact principles can and should apply to high integrity renewable energy, as for a nature based REDD+ activities. Our view is that in reality the carbon type is far more nuanced, and therefore categories are required to ensure that all carbon and programme types can be adequately represented under the AF/AP/CCPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                                                                 |
| 190 | Anonymous            | Part 1: Introduction | ge              | Nature based carbon activities                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0                                                                                                                                                                                                                                                                                                                                                 |
| 190 | Anonymous            | Part 1: Introduction | ge              | It is now widely understood and accepted that a 1.5°C global threshold cannot be met, without the protection, management and restoration of natural ecosystems (nature-based solutions for climate), with a significant proportion of the finance required coming from the voluntary carbon market. It is FFI's view that nature-based solutions to climate can and must play a significant role accelerating the transition to and that high integrity of this approach is achievable. It is therefore counterintuitive that the approach presented by the IC-VCM, can be expected to significantly reduce confidence and demand in this vital sector, while simultaneously slowing the development of the supply pipeline development. This is specifically highlighted in the Permanence criteria – where nature based activities are singled out as high material risk and will therefore have additional requirements imposed upon them. The reality of the implications of the proposed requirements on the projects themselves (and the programmes) in terms of costs, risk, and capacity to deliver, must be understood in more detail, stress tested over a time period and refined, before being written into the CCPs and AF.                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                 |

| 190 | Anonymous                                          | Part 1: Introduction | ge              | XXX has concerns over the structure of tagging on attributes to an otherwise carbon centric product. Specifically relating to nature based projects, the positive impact for biodiversity and people must be understood as core to the mitigation activity, rather than an additional attribute that is a 'nice to have'. By introducing tagging options as optional add-ons, rather than being clear that certain attributes being fundamental for a high integrity credit, you risk the race to the bottom in terms of quality and price; where tagging costs more, but doesn't really add benefit to the buyer. More concerning still, is that the resilience of the climate outcomes themselves are at risk where communities (particularly IPLCs) and biodiversity are not adequately addressed by projects. If tagging is to be considered, the elements of biodiversity and social positive impacts must become fully integrated over an agreed time frame, becoming core-benefits, rather than co-benefits. Without these elements, no nature based carbon programme can really consider itself high integrity.                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 190 | Anonymous                                          | Part 1: Introduction | ge              | XXX agrees with the principles outlined under the SDGs, but alongside the details on Safeguards, we are concerned that the underlying emphasis is on achieving no net harm, rather than positive impact. For carbon credits to be considered high integrity, no net harm is simply not going far enough, when there is an opportunity to drive real positive impact on the ground through mitigation activities. There is little evidence of how net positive impact for biodiversity will be incorporated into the CCPs/AF. In fact no harm minimisation is identified (or presented) as a high priority, rather than driving positive impacts. The AF should therefore be based on mitigation activities that explicitly benefit biodiversity and the wider SDGs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 190 | Anonymous                                          | Part 1: Introduction | ge              | The targeting of nature based activities as having high material risk (more so than other activities) appears to be too simplistic in order to be accepted as a defining principle. Nature based carbon activities from AFOLU and seascapes do present risk, but this risk is well understood and can be managed accordingly, with ongoing support and the appropriate use of buffer pools and other mechanisms to compensate for reversals. In addition, this risk management itself should in part, be paid for by the emitters/buyers (not the project developers) - current proposals place an intolerable level of risk on project developers, which would inevitably limit the ability of grassroots organisations and communities to develop effective REDD+ interventions and secure threatened forests and limit the risk of devastating tipping points being reached. Further concerns are raised over the assumed lack of material risk for undeveloped, untried and untested novel technologies, which are many years from being mainstreamed and having any significant mitigation impact. The net effect of the current criteria seems set to significantly limit the ability of the VCM to incentivise or support scale up action to protect and sequester carbon through nature. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 191 | Carolyn Ching                                      | Part 1: Introduction | ge              | Nature plays a key role in reaching the global goal of limiting warming to 1.5C, and efforts to end deforestation, improve land management, and restore land are greatly in need of financing. The CCP criteria are skewed against NCS projects and inadvertently place a higher burden on NCS projects and jurisdictional REDD programs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Specific comments are provided in the CCP on key criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 192 | Individual/employee, Carbon Engineering/1PointFive | Part 1: Introduction | ge              | We welcome the work of the IC-VCM and are fully supportive of its mandate to create a set of universally applicable core carbon principles that signal integrity in voluntary markets. This work is critical to modernize voluntary carbon markets and ensure that they generate products with environmental integrity that support the project finance required to drive climate action. Voluntary carbon markets are key to accelerating the transition towards net zero by allocating private capital to carbon dioxide removal projects - such as direct air capture - [while nation states and trading blocs continue to negotiate binding carbon caps and prices]. To date, purchasers of carbon removal from the voluntary sector have played a key role in kick-starting some of the first DAC-with-sequestration projects, and we need this trend to both continue and accelerate. which is necessary to assign value to climate change mitigation.                                                                                                                                                                                                                                                                                                                                     | We welcome the work of the IC-VCM and are fully supportive of its mandate to create a set of universally applicable core carbon principles that signal integrity in voluntary markets. | 193 | Individual/employee, Oxford Net Zero            | Part 1: Introduction | ge              | 1 "By creating a standardised benchmark, the draft CCPs and Assessment Framework are designed to reduce confusion and fragmentation" (...)2- "As a result, the VCM will become more effective at mobilising additional capital, and channeling it efficiently towards the most impactful, cost-effective climate-mitigation activities, regardless of where on the planet it occurs. This is particularly important for developing economies where there is significant opportunity to develop mitigation activities. Ninety percent of potential nature-based solutions, for example, are located in the Global South."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 2- "As a result, the VCM will become more effective at mobilising additional capital, and channeling it efficiently towards the most impactful, cost-effective climate-mitigation activities, regardless of where on the planet it occurs. It can also act as a delivery vehicle to connect the financial gains generated from the voluntary carbon market with much-needed adaptation efforts. This can be done by adopting a Share of Proceeds for Adaptation (SOPA) stipulation to ensure that a portion of proceeds from exchanges in the voluntary carbon market are sent to benefit the Adaptation Fund to assist developing countries meet the costs of adaptation." |

The current approach is inherently discriminatory toward low-capacity places that could deliver high-integrity mitigation, and a burden-of-proof approach should be designed to minimize this inequitable effect.                                                                                                                                                                                                                                                                                  |
| 194 | Individual/employee, Conservation International | Part 1: Introduction | ge              | Binary Pass/Fail Approach Screens out viable mitigation without creating a stepwise pathway to inclusion, suppressing short-term action. Investors will not want to invest in projects that don't pass IC- VCM even if they have been certified by a carbon standard/VVB, which is bad for market development and acceptance of standards. The creation of a binary approach also creates negative messaging in the market to investors by suggesting that many NCS projects are of bad quality. IC-VCM was originally conceived as a market benchmark, not this type of punitive pass/fail threshold standard. Benchmarks by definition are used to compare similar assets against each other relative to a benchmark, which in turn affects market pricing relative to how asset fares against benchmark and individual buyer choices of what they want to buy based on comparison to benchmark. Mission creep has led IC-VCM to deviate from this benchmark ratings approach to a binary pass/fail approach which risks fundamentally undermining the market as a whole.                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 195 | Individual/employee, Conservation International | Part 1: Introduction | te              | The current approach has the effect of treating all risks and threats as equally important factors to exclude activities, rather than allowing for tailored approaches to manage and address risks. In line with traditional financial market risk management approaches it would be more appropriate to apply risk adjusted weighted approaches like RAROC to accurately reflect the true quality and delivery risks. Under the current approach, projects that don't pass the binary approach will be perceived as junk, instead of allowing for a graduated scale of quality that buyers can decide whether to buy and how to price based on their individual risk profiles consistent with traditional financial market benchmark practices. A graduated scale allows for mitigation proponents to deliver a higher burden of proof for the integrity of their credits, rather than simply being disqualified from participation completely. Furthermore, a graduated approach means that the accepted threshold for quality along each dimension of the framework can become more stringent over time, providing for continuous improvement while still opening market opportunities today. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 196 | Individual/employee, Conservation International | Part 1: Introduction | ge              | Phase 2 timeline & Phase 1 threshold level should be set to avoid suppressing short-term action. Final IC- VCM guidance needs to allow the VCM to support immediate and urgent action. As highlighted in the recent IPCC report we are at risk of going over a dangerous tipping point in next 4-5 years, so any action that can be taken in short-term should be. Given urgency –ICVCM should prioritize not killing the market/momentum in short-term. The required review to modify the standards to meet the proposed requirement will take significant time (eg. 1.5y) to go through the public review process and avoid violation of the proposed carbon standards program governance requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Give minimum 4 years to adjust and make it more realistic for is possible for investors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 198 | Individual/employee, Conservation International | Part 1: Introduction | ge              | Concern with specific credit methodology focus: The focus on each methodology gives IC-VCM power to dictate between standards & also adds significant effort and timeline to achieve compliance. Doesn't make sense to review each methodology.                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0                                                                                                                                                                                                                                                                                                     |
| 199 | Individual/employee, Conservation International | Part 1: Introduction | ge              | Cross-cutting feedback:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | N/A                                                                                                                                                                                                                                                                                                   |
| 199 | Individual/employee, Conservation International | Part 1: Introduction | ge              | Concern with vested interest of standard setters. In normal financial markets the standards setting body is neutral regulatory entity (e.g. SEC) and staff are not involved in any market activities. The concern is that IC- VCM- decisionmakers and science providers themselves are market stakeholders. This introduces potential for bias and gives IC-VCM disproportionate power. This is feedback from financial market players, one of which wants to invest in carbon projects.                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                     |
| 200 | Peter Hurrell                                   | Part 1: Introduction | ed              | The Integrity Council will have a range of interventions to ensure integrity is maintained in the market in the event a concern arises; in the first instance we will engage with the program and may recommend improvements to maintain CCP-eligibility. Where this is not implemented, the Integrity Council can suspend CCP-approval of a program, or terminate approval in severe cases.                                                                                                                                                                                                                                                                                               | It is our recommendation that the Integrity Council should establish an insurance fund analogous to those that are operated by clearing houses and organisations such as the European Federation of Energy Traders.                                                                                   |
| 200 | Peter Hurrell                                   | Part 1: Introduction | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | If the Integrity Council is effectively the regulatory authority for the market and can take unilateral decisions to exclude market participants due to non compliance then it must establish this type of mechanism to be taken seriously and be considered more than a complex labelling operation. |

| 200 | Peter Hurrell                                   | Part 1: Introduction | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | This fund could be used - amongst other things - to cover losses and/or replace credits which have been issued by a program that has lost its CCP approval or to compensate projects which are affected by force majeure preventing them from delivering on their commitments.                        |
| 201 | Dominique Souris                                | Part 1: Introduction | ge              | Overall, the movement toward transparency, standardization and accountability in the voluntary carbon market is welcomed. Building integrity by providing a credible, rigorous and readily accessible means of identifying high-quality carbon credits is an important step toward strengthening and scaling the voluntary carbon market. Having clear criteria will help drive confidence of corporate buyers and suppliers, and accelerate the uptake of emerging technologies while also protecting and promoting nature and biodiversity.                                                                                                                                              | N/A                                                                                                                                                                                                                                                                                                   |
| 202 | Dominique Souris                                | Part 1: Introduction | ge              | The proposed framework positions the ICVCM as a quasi-regulatory body, providing guidance and guardrails for carbon credit integrity and establishing approvals and compliance procedures for market actors. This structure leaves questions around how the ICVCM will interact with existing voluntary carbon market registries and certification bodies in practice without injecting unnecessary duplication into the system, and how its governance structure will evolve over time.                                                                                                                                                                                                   | N/A                                                                                                                                                                                                                                                                                                   |
| 202 | Dominique Souris                                | Part 1: Introduction | ge              | There are further questions around how the CCPs will integrate where there is a convergence between voluntary and compliance markets. This convergence is a growing trend, with some jurisdictions beginning to establish their own set of credit quality protocols and enabling these credits to be bought and sold in both compliance and voluntary markets. Will those projects now be looking to be both CCP-eligible in addition to government certified? Given the potential for duplication and increased costs of compliance for project developers, it will be important for the ICVCM to engage governments and consider how various protocols and guardrails can work together. | 0                                                                                                                                                                                                                                                                                                     |
| 203 | Ivan VALENCIA                                   | Part 1: Introduction | ge              | The Global Green Growth Institute is pleased to provide comments on the Core Carbon Principles (CCP) of the Integrity Council for the Voluntary Carbon Markets (ICVCM). We do so based on our expertise of working in more than 30 countries advising them on carbon pricing, Article 6 readiness, climate financing and climate action in general. GGGI supports high standards of environmental integrity, but we also bring the voice of developing countries where we work that aim to become potential sellers in the international carbon market, and to increase ambition on their climate action with the help of carbon markets.                                                  | Refer to comment made on this section                                                                                                                                                                                                                                                                 |

| 203 | Ivan VALENCIA                                          | Part 1: Introduction | ge              | We welcome the initiative of the ICVCM and the effort placed in developing the proposal of CCPs with the aim of becoming a global benchmark for carbon crediting programs of the voluntary carbon market. We also welcome the division of stages between the Initial and Full thresholds of compliance with the CCPs, enabling a transition period for programs that want to incorporate the top-tier best practices. However, in our experience advising developing countries including least developed countries, we are constantly battling with the reality of aiming to meet standards set by developed countries that are not aware of the national circumstances of these countries and the costs involved in meeting these standards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 203 | Ivan VALENCIA                                          | Part 1: Introduction | ge              | Aa general comment, we believe that the global voluntary carbon market will be better served if the ICVCM creates greater distinctions between the Initial and Full Thresholds so that the Initial threshold becomes the "floor" of environmental and social integrity, and the Full becomes the "Best practice". Right now, the Initial requirements are quite extensive for them to become the floor or the minimum acceptable practices by carbon crediting programs all around the world. The big risk is that the ICVCM CCPs become a premium label only obtained by a sliver of the market, or where the CCPs become a required criterion that only very few actual projects are able to meet on the ground, delaying climate action instead of promoting it.. This is the risk of many sustainability certifications that fail to penetrate the market beyond its higher tiers. The ideal situation would be one where all the carbon crediting programs should seek certification by the CCP Initial Threshold, otherwise risk being labeled as high-risk or junk credits. On the other hand, the Full Threshold certification would be reserved for the premium market.                                                                             | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 203 | Ivan VALENCIA                                          | Part 1: Introduction | ge              | Therefore, a general recommendation would be to make a bigger divide between the requirements of the minimum environmental, social, corporate integrity that is needed, and use those to develop the Initial threshold, and take the rest to the full threshold. The initial threshold should be simplified to make it attainable with the minimum necessary integrity. Particularly in some topic areas, there is little difference between the requirements of the initial and full thresholds, such as in safeguards, additionality, permanence; and this may be a big deterrent for programs to seek CCP certification. The requirements developed in Glasgow for Articles 6,2 and 6.4 are a useful guide to determine the "floor" requirements of voluntary carbon markets, since these were the product of painstaking negotiations that were agreed by more than 190 countries. At the very least, the Initial CCP threshold should be somewhat similar in terms of environmental integrity requirements to those of the Article 6.4 mechanism of the Paris Agreement but not necessarily go beyond these This is also in recognition that some VCM projects fail to meet these standards nowadays but it is hard for the market to distinguish them. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 204 | Individual/employee, ANSI National Accreditation Board | Part 1: Introduction | ge              | The scope of IC is not entirely clear. If the goal of IC is to benchmark carbon programs and to assess programs against that benchmark this could be more clearly stated and relationships between responsible parties more clearly illustrated. For example, it is not clear how IC-VCM will interact with existing stakeholders such as accreditation bodies and validation/verification bodies. An additional objective as described of IC is to also approve methodologies and projects. As this process is currently already undertaken by many of the program operators, further consideration should be given to the benefits of potentially duplicating established roles. Duplicate of effort may only slow down the scaling of markets and increase costs. The IC could address this issue using different methods. Consider examples provided from other sector-specific benchmarking schemes such as GFSI, etc.                                                                                                                                                                                                                                                                                                                                  | Provide more clear articulation and illustration of IC-VCM authority and responsibilities of stakeholders. Consider pros and cons of duplicating efforts already undertaken by other organizations. Consider other models that have more experience with benchmarking of schemes such as GFSI.                                                                                                                                                                                        |
| 205 | Peter Hurrell                                          | Part 1: Introduction | ed              | At this point in time, the Assessment Framework does not distinguish between different uses of carbon credits. In order to set an appropriate level of stringency for the draft CCPs and Assessment Framework, the drafts are based on the assumption that credits may be used by companies to compensate for residual emissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | This may be shortsighted as oversight must be fully end to end in order to truly guarantee integrity. How corporations are reporting credits acquired in the voluntary markets should be reconciled with the central registries and depot accounts and all the way back to the project that delivered them.                                                                                                                                                                           |
| 205 | Peter Hurrell                                          | Part 1: Introduction | ed              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | In the case of technology based carbon removal, the risk for double counting is even greater as in many cases the CO2 removed can be used as a raw material for industry. This will need to be monitored and controlled also as their is a risk of bad actors counterfeiting bottled CO2 or Bicarbonate of Soda produced with CO2 removed from the atmosphere as it is highly likely that there will be a price difference between these products and their pre-existing equivalents. |
| 206 | Individual/employee, Rights and Resources Group        | Part 1: Introduction | ge              | Indigenous Peoples and local communities need to be either written in full throughout this text or in clearly separated form, if acronyms are preferred: e.g., "IPs and LCs" or "IP and LC".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Clarify how IPs and LCs will gain / benefit from these investments, in terms of their ability to pursue their self-determined climate, conservation, and sustainable development priorities.                                                                                                                                                                                                                                                                                          |

| 206 | Individual/employee, Rights and Resources Group | Part 1: Introduction | ge              | While the primary beneficiaries of intended VCM investments appear to be IPs and LCs, it remains unclear how the latter will benefit from these investments, and under what terms. Given that at least half of their customary lands and forests have yet to be legally recognized, it is unclear how these investments will accelerate a just rural transition, and whether state approval of these transactions will be required to ensure legitimacy and transparency. In the event that the latter holds true, how will the CCP help communities secure their land and resource rights? | 0                                                                                                                                                                                                                                                                                                                                                                                                      |
| 207 | Peter Hurrell                                   | Part 1: Introduction | te              | A transparent price signal should also work to ensure the VCM provides more effective economic incentives for companies to rapidly decarbonize their value chain, rather than relying on carbon offsetting to meet their commitments.                                                                                                                                                                                                                                                                                                                                                       | Traditional industry is already leveraging technology to accurately measure their carbon footprint with significant advances in the shipping and commodities industries having occurred in the past 12 months. Corporations are leveraging sensor technology, IoT, Machine Learning, and Blockchain technologies in order to track the CO2 emissions of container vessels in real-time as one example. |

| 207 | Peter Hurrell                                   | Part 1: Introduction | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Adopting technology solutions rather than "teams of trained personnel" will enable a fully automated circular market with demand generated from these real-time CO2 emissions monitoring systems easily routed directly to fully automated verification and securitization of carbon removal and sequestration projects.                                                                               |
| 208 | Anonymous                                       | Part 1: Introduction | ge              | XXXX is supportive of the Integrity Council for the Voluntary Carbon Market (the Integrity Council), the Core Carbon Principles and the Assessment Framework. We welcome the Integrity Council's leadership in the voluntary carbon market and the credibility the Integrity Council can bring to carbon credits and carbon-crediting programs. With over 20 global standards in the VCM, consistency of definitions and their interpretation is needed. We support the Integrity Council in creating this consistency and becoming the main governing body in the VCM.                     | XXX has suggested changes further down in this document.                                                                                                                                                                                                                                                                                                                                               |
| 209 | Ronan Carr                                      | Part 1: Introduction | ge              | BeZero Carbon welcomes the opportunity to comment on the Integrity Council (IC-VCM) and Core Carbon Principles (CCPs). We wholeheartedly support the intention to raise standards of quality and integrity across the VCM. This purpose is very much aligned with BeZero's own mission to provide ratings, research and analytics that help market participants assess quality and manage risk, that help to build and scale the VCM, and that ensure the VCM contributes positively to global climate change mitigation goals.                                                             | see cross cutting comments                                                                                                                                                                                                                                                                                                                                                                             |
| 209 | Ronan Carr                                      | Part 1: Introduction | ge              | From an analytical perspective the major positives in the CCPs relate to stronger levels of project disclosure, increased rigour in the quantification and audit of carbon accounts, and greater standardisation and transparency across carbon-crediting programs.                                                                                                                                                                                                                                                                                                                         | 0                                                                                                                                                                                                                                                                                                                                                                                                      |
| 209 | Ronan Carr                                      | Part 1: Introduction | ge              | Mandating much stronger minimum standards of disclosure is by far the most important requirement of the draft CCPs. This addresses a key flaw in the VCM as it exists today. BeZero considers the provision of basic project information (e.g. on the project location and proponents) to be essential for all stakeholders and the wider public to gain confidence in the VCM. Moreover, much of the proposed disclosure requirements should not be onerous for developers or registries to implement.                                                                                     | 0                                                                                                                                                                                                                                                                                                                                                                                                      |
| 209 | Ronan Carr                                      | Part 1: Introduction | ge              | Ensuring increased rigour in the quantification and auditing of emissions reductions is equally welcome. BeZero's analytical approach seeks to categorise the carbon accounts of all VCM projects using a standardised data template providing clarity on the building blocks of credit issuance including baselines, project emissions and adjustments for leakage and risk buffers. The IC-VCM proposals are aligned with this approach which we welcome.                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                      |
| 209 | Ronan Carr                                      | Part 1: Introduction | ge              | Increasing standardisation across registries and programs is another important objective to help scale the VCM. Such efforts represent relatively low hanging fruit. In particular, BeZero would like to see greater consistency across registry data and data reported within project documentation; and to see greater transparency around the calculation and management of non-permanence risk buffer pools.                                                                                                                                                                            | 0                                                                                                                                                                                                                                                                                                                                                                                                      |
| 209 | Ronan Carr                                      | Part 1: Introduction | ge              | The challenge the CCPs face is around acceptance from existing stakeholders. This is because additional reporting and monitoring requirements are viewed as costly, onerous and/or impractical. This could be the case for example with proposed new monitoring and reporting requirements for sustainable development impacts and safeguards.                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                      |

| 209 | Ronan Carr           | Part 1: Introduction | ge              | While the CCPs advocate a risk-based approach in some instances, ultimately they are intended to create a minimum threshold for carbon credit integrity. BeZero is supportive of a risk-based analytical approach. However, the nature of the CCP eligibility label means there is a trade off between achieving an accurate assessment and one that is efficient and workable. BeZero is concerned that in some instances the assessment framework and procedures are overly prescriptive and detailed. Specific criteria within Additionality (e.g. regarding regulation) lack sufficient nuance to provide fair outcomes in all cases. The CCPs may achieve broader acceptance and adoption if the assessment procedure follows a mostly top down approach.            | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | As a carbon credit rating agency BeZero's role is very complementary to that of the CCPs and IC-VCM. Both have a role to play in strengthening the information architecture that the VCM requires to achieve its potential. By their nature BeZero ratings incorporate a much more detailed due diligence of project specific information that is beyond the scope of the CCPs or any similar integrity tag.                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | Ratings and the CCPs can each reinforce their role as guarantors of quality in the VCM. By emphasising higher minimum requirements for disclosure, monitoring and reporting at a project level along with increased standardisation and transparency at a program and registry level, the CCPS can help to both raise standards across the VCM and reduce information asymmetry. In turn rating agencies will improve understanding of risk and value in the market, encouraging a race to the top from all stakeholders.                                                                                                                                                                                                                                                 | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | As an illustration of the importance and value of better disclosure we highlight below some statistics from a pilot study of transparency in the VCM we have undertaken. We believe these statistics show the extent of problems in accessing fundamental project information and data. Such information gaps are the key weakness in the current VCM.                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | Our pilot study covered 128 projects across four major registries: Verra's VCS, Gold Standard, Climate Action Reserve, and the American Carbon Registry. Projects from a variety of sectors were selected based on the highest outstanding issuance from the last five years, representing the most liquid credits in the market.                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | Each project was analysed and assigned a transparency score based on a series of 20 questions, interrogating project details such as developer information, financial disclosures, methodology, project design, carbon accounting methods, and stakeholder inputs. A higher transparency percentage indicates that the project has divulged project details and made more information public, while a lower score indicates a lack of available information or detailed disclosures.                                                                                                                                                                                                                                                                                      | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | Selected results from the study include:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | · 18% of the sample did not provide project location information - leaving no way to physically verify the project's details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | · 92% of NBS projects do include some form of project boundary. However, insights from BeZero's Earth Observation team highlight that many are riddled with inconsistencies. For a sample of 81 NBS projects evaluated, only around half provided a project boundary in a spatial format to the registry. Of these, one in five had analytical issues, e.g. the boundary provided contradicts what is stated in the project's description.                                                                                                                                                                                                                                                                                                                                | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | · Only 19% of projects in our study provided either a non-permanence risk report or an explanation of their buffer pool allocation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | · 25% of projects do not provide full and clear information on the baseline methodology / calculation. Meanwhile monitoring plans and calculations were shown clearly by 30.5%.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 209 | Ronan Carr           | Part 1: Introduction | ge              | In addition to raising transparency standards for carbon projects we also advocate measures to address mismatches in data reported in registries and in project documentation. For example, we observe discrepancies between reported credits to be deposited in project monitoring and verification reports and credits actually paid to the registry's buffer pool. In certain cases, these discrepancies are consistent with registry guidelines around buffer pool credit issuance. For example, a lack of buffer credit issuance may be related to applied insurance schemes or registry guidelines on alternative developer holding accounts. However, in certain instances, we also note a lack of public disclosure on the discrepancy in buffer credit issuance. | 0               |

| 209 | Ronan Carr           | Part 1: Introduction | ge              | Within our universe of rated projects that are required to deposit risk buffer credits, we find that 54 of 79 projects exhibit discrepancies between the number of buffer credits noted in monitoring reports and the number issued to registry-held buffer accounts. These discrepancies on average result in an possible under-issuance of buffer credits to the registry. Whilst this represents a majority of nature based projects we have rated (68%), we find that the average under-issuance of credits from these projects contributes to a 38% increase to total registry buffer credits if issued.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                         |
| 210 | Thomas Hämmerle      | Part 1: Introduction | ge              | To meet the Paris climate targets, financial incentives are needed for all scalable, mature technologies that can potentially remove gigatons of CO2 from the atmosphere. In particular, technologies and concepts with a high degree of maturity, that simultaneously mitigate climate change and mitigate its effects should be supported as good as possible. The reason for this is, even the most optimistic climate scenario presented in the current IPCC report assumes only a 50% probability of meeting the 1.5°C with all the efforts (reduction and removal). Accordingly, not only the most effective technologies should be promoted, but especially technologies capable of mitigating climate change and leading to climate change adaptation. For example, technologies like pyrolysis and gasification lead simultaneously to multiple benefits for climate change mitigation and adoption:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Original: "This could include nature-based solutions and emerging breakthrough technologies that are difficult to commercialise today, for example."                                                                                                                                                                                                                      |

| 210 | Thomas Hämmerle      | Part 1: Introduction | ge              | 4. Carbon sink in the form of biochar leads to climate change adaptation when applied in agriculture or construction, e.g. increasing water storage capacity in soils or insulation effect in construction materials.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                         |

Ninety percent of potential nature-based solutions, for example, are situated in the Global South1."                                                                                                                          |
| 210 | Thomas Hämmerle      | Part 1: Introduction | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Extension to: "Nevertheless, an improved biomass management in the global north should be coequal considered e.g. using pyrolysis or gasification for residue upcycling. Beside the impact of , climate change mitigation and adoption it will lead to a more global climate justice, as well as serve as a role model for climate and social smart resource management." |
| 211 | Anonymous            | Part 1: Introduction | ge              | We agree that it is critically important to establish "Core Carbon Principles" which set minimum global threshold standards across a variety of criteria categories for the voluntary carbon market. Having a basic, universal standard for what constitutes a legitimate carbon credit will enable market participants to accelerate investment and scaling of projects that create credible, trustworthy climate impact. The urgency of the climate crisis demands no further delay to credible action, and to that end, we recommend that the ICVCM look to simplify and reduce the criteria for CCPs (as the term core carbon principles would suggest) to only those factors that impact carbon emissions and accounting, and allow the markets and other actors to provide additional evaluations and ratings of factors beyond the carbon impacts of the underlying project credits. Our recommendation is intended to promote the CCPs as a framework that current or future projects within the voluntary carbon market can utilize as a minimum benchmark to improve quality across the carbon sector overall. At the same time, we feel that this framework should not inadvertently exclude or inhibit projects that are in a quality growth phase from accessing carbon financing that would in turn allow them to improve their carbon emissions outcomes, overall credit quality and other project co-benefits. | cross cutting general comment                                                                                                                                                                                                                                                                                                                                             |
| 211 | Anonymous            | Part 1: Introduction | ge              | The current voluntary carbon market is still relatively new and many of the key determinants of carbon credit quality are still being sorted through. It is premature to establish criteria that will be considered "core" to the industry when the market itself is not sufficiently understood by its own participants. The ICVCM should proceed with standards for what are widely accepted as the critical factors for carbon credit quality and consistency, while allowing price discovery and market maturation to reveal the factors that are material over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                         |

| 211 | Anonymous            | Part 1: Introduction | ge              | As a substantial player in the carbon offset project business we recognize the critical role of nature based climate solutions in combating climate change and achieving various ecological and sustainable development goals. Voluntary carbon markets are one of the only sources of sustainable finance available to nature based solutions. The ICVCM should give special consideration to these solutions to support as much investment for high quality conservation and restoration programs as possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 211 | Anonymous            | Part 1: Introduction | ge              | We support the broad ambition of the ICVCM, but feel that the CCPs as currently drafted lack clarity for guiding principles such as additionality and permanence, and in other areas overstep the original ICVCM's mandate by attempting to dictate broader market policy and function thereby risking buyin. We commend the ICVCM for its efforts thus far, but strongly urges the chair and all members to narrow the scope of criteria to truly reflect "core carbon principles" and to provide clear, practical guidance on how certain criteria, if adopted, could be practically implemented in the real world. The definition and standard for a carbon credit should rightly be high, but should be limited to core principles such as additionality, permanence, quantification, measuring, reporting, and verification (MRV), and unique ownership and claims, with incentives for transparency and reporting to allow the market to value additional non-carbon attributes.                                                                                                                                                                                                                       | 0               |
| 212 | Darcy Jones          | Part 1: Introduction | ge              | EDF supports the IC-VCM's mission to create a clear set of principles for quality, including social and environmental integrity. Carbon credits have accomplished incredible things when done right, from raising funds for the Yurok tribe, to buying additional ancestral land, to supporting forest communities in Mato Grosso. This scale of financing can support the livelihoods of Indigenous and local communities by improving land tenure and expanding sustainable development programs that generate jobs and sustainable incomes. It will take hard work to ensure these benefits are the rule, not the exception. The concerns that many communities have expressed about carbon markets are legitimate. We will fail if we do not truly listen to the voices of those who rightly point out what happens when we get markets wrong, and we cannot afford to undermine our climate action by generating or selling credits into the market which fail to meet high standards. With concerted effort, carbon markets could mobilize 4 trillion USD every year, and secure billions of tons of additional emissions reductions--creating a safer climate for all. That is the goal we all share. | N/A             |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | The Yale Carbon Containment Lab (CC Lab) appreciates the opportunity to comment on the ICVCM's Core Carbon Principles and associated Assessment Framework. Founded in January 2020 as part of Yale University's School of the Environment, the CC Lab advances novel carbon removal and mitigation methods and engages market actors to facilitate deployment and scale-up. Our comments and suggestions build on our team's many combined decades of experience in institutional investing, large-scale sustainable purchasing, evaluation of standards for the US federal government, and multi-stakeholder coalitions. In addition, we bring the perspective of a developer of novel methods for carbon removal, yet to be launched on the carbon credit markets.                                                                                                                                                                                                                                                                                                                                                                                                                                         | See above.      |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | It is of vital importance that the voluntary carbon credit markets maintain integrity and advance sustainable innovation in order to decarbonize and mitigate global climate change rapidly. Therefore we support and acknowledge the ICVCM in taking on the task of building a more transparent marketplace for buying, selling, and financing carbon credit generating projects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | The scope of work the IC lays out for itself in this draft is time-consuming, resource-intensive, and contingent on expertise across many mitigation activities. It is important that this does not itself become a bottleneck for climate action. Vetting each individual credit type for adherence to the CCPs in each region would be a valuable but immense undertaking; and one that would need to be continually updated as technologies and regional conditions change. We worry that in practice the expert panels will move too slowly, favoring those credit types which begin at the front of the evaluation queue. We would like to better understand the resources and governance of the IC to know that it can effectively meet its mandate in an unbiased way. To this end, we think it is important that Assessment Procedure address the following considerations:                                                                                                                                                                                                                                                                                                                          | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · How the IC will ensure its Expert Panel has sufficient expertise for a given credit type or mitigation activity in a given region.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |

| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · “Core Carbon Principles” should be consistently expressed as high-order, fundamental, and aspirational. Given the broad scope the IC seeks to occupy, the CCPs should form an easily communicable and widely agreed-upon foundation for work across geographies, mitigation activities, and stakeholders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · However, as written, the CCPs are a mix of principles and second-order indicators and attributes that could be measured, and as a result are confusing and do not describe integrity. The ISEAL Credibility Principles (for sustainability standards and labels) and the ANSI Essential REquirements provides an instructive example for how to state principles as a core value, with an associated norm describing and defining the principle, coupled with further assessment criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | o For example, “Mitigation activity information” is an indicator of the broader principle of “Transparency.” Transparency is currently included as a criterion (1.5) under “Program Governance,” but like most sustainability principles (e.g. PRI, ISEAL Credibility Principles, etc.) the broader principle should be re-labelled “Transparency” with Assessment Framework requirements describing what should be made transparent to whom.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · We recommend that the CCP “Permanence” should be replaced with “Durability”. Particularly for many nature-based mitigation activities, true permanence is unattainable; and complicated by accounting rules and conventions such as 100-years, which are not science-based and complicate understanding true performance. Replacing “Permanence” with the principle of “Durability” will improve precision and the ability of market actors to assign value, and emphasize the necessity of long-term reduction or removal as an aspirational goal.                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · We recommend that a new CCP of “Innovation” be added. Many standards systems quickly become out-of-date and closed to new entrants, favoring incumbents and losing relevance as new technological advances enable new information and action. While innovation needs to be balanced with institutional stability, it is important to ensure that there are ways in which innovative methods as well as new organizations can participate and advance climate action in many different jurisdictions. If the ICVCM itself wants to remain a comprehensive and central body, it should provide on-ramps for new actors and methods, and encourage registries and other market actors such as verification bodies to build processes that enable and advance innovation. New registries, and new approaches to verification, should be encouraged to participate in ICVCM processes. Example indicators that would measure whether a system encourages or enhances innovation include: | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | o The extent to which registries provide ways for new methods being proposed by new actors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | o How rapidly new methods can be developed, evaluated and deployed by an existing registry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | o Specifically, the requirement that registries must exist for at least two years before being considered by the ICVCM (Criterion 9.4(b)) should be revisited; as this will favor incubants and block innovation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |

| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · We recommend that a new CCP of “Stakeholder engagement” be added. Example assessment framework indicators that would measure whether a system encourages or enhances stakeholder engagement include the extent to which a wide range of stakeholders are able to engage in standard setting or methods setting activities, whether their views are acknowledged and listened to. There are already numerous ways in which high quality stakeholder engagement processes can be formulated and prescribed, for example, in the ANSI Essential Requirements stipulate openness and balance, and clear distinctions between due process and decision-making protocols. <a href="https://ansi.org/american-national-standards/ans-introduction/essential-requirements">https://ansi.org/american-national-standards/ans-introduction/essential-requirements</a> . | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · We recommend that a new CCP of “Transparency” be added. Example assessment framework indicators include:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | o Registries and entities associated with generating carbon credits such as verification bodies and project developers should disclose their processes, funding sources, business models and other material concerns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · We recommend that a new CCP of “Coordination and Harmonization” be added, to encourage different registries and market-actors to reduce duplicative efforts, and increase interoperability of data-systems such as the use of Tags. Assessment Framework indicators could include the evidence that good faith efforts are made to resolve potential conflicts between different registries and standards-bodies (per ANSI Essential Requirements), and/or that Tags and meta-data are consistently gathered and applied.                                                                                                                                                                                                                                                                                                                                     | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · Business Process Integrity. We recommend that criteria relating to program/registry security should be added, perhaps under one of the program-level CCPs such as Program Governance. This is a precondition to program integrity that will become ever more important as voluntary markets scale-up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | Comments on potential credit attributes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 213 | Charlie Mayhew       | Part 1: Introduction | ge              | · We do not think the IC should mandate the attribute tags of “reduction”/“removal” and “biological”/“technological.” We agree in principle that registries should have interoperability and some common terminology; and that basic labeling of type of mitigation activity may be helpful for a variety of reasons. But the binary tags chosen are too simplistic and do not adequately describe the full range of climate actions that carbon credits may support. Many mitigation interventions deploy technology within natural systems. Many removal actions also help mitigate emissions while removing them using natural processes. Keeping such a binary delineation could create more not less confusion in the marketplace, obfuscate important risks, and potentially stymie innovation.                                                           | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | Joint MDB Response to the IC-VCM's CCPs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | N/A             |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | The Integrity Council for the Voluntary Carbon Market (IC-VCM) has solicited comments from the public regarding the draft publication of its Core Carbon principles, Assessment Framework and Assessment Procedure (hereinafter CCPs), the objective of which is to ensure the Voluntary Carbon Market (VCM) grows at scale with integrity to support accelerating a just transition to 1.5°C.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | VCM has an important role in spurring climate actions through creating markets for technologies/nature and leveraging investments needed for countries to meet their Nationally Determined Contributions (NDCs). While countries are developing their capacities to support and implement carbon markets under Article 6 of the Paris Agreement, voluntary markets are expected to provide the needed momentum to support the climate action by the private sector, unlock the finance, and establish rules and requirements that support high integrity and pave the way for compliance markets. Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA) is one such example where mandatory carbon market regulations can be introduced on the back of an in origin a voluntary market.                                                    | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | In this context, the Working Group of Multilateral Development Banks (MDBs) on Article 6 of the Paris Agreement (hereinafter MDB WG) has been working to support countries with their capacity and in developing mitigation programs which can scale up mitigation in line with the bottom-up approach of the Paris Agreement and exploring innovative and harmonized approaches between different types of market activities for ensuring their credibility, transparency, and integrity.                                                                                                                                                                                                                                                                                                                                                                      | 0               |

| 214 | Seoyi Kim            | Part 1: Introduction | ge              | While detailed comments on CCPs are provided below, the MDB WG views that the IC-VCM should focus on identifying and endorsing eligible carbon crediting programs and standards that have systems in place to deliver on the core carbon principles. The IC-VCM and the proposed Assessment Framework should not implement the core carbon principles at the level of methodologies of the eligible standards. The Assessment Framework to determine the eligible standards should build upon the work being done by CORSIA and International Civil Aviation Organization. The Assessment Framework should clearly demonstrate a value proposition and should not duplicate considerable effort that has been put on these approaches. The eligible standards should be invited to the Technical Committee that harmonizes methodologies across standards for similar use cases and ensures the application of the core carbon principles at the level of methodologies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | While we recognize the importance of stand-alone projects and the focus that IC-VCM puts in these documents, given the need for innovative and scaled-up approaches to support increasing the ambition of countries' climate action, it is important that IC-VCM also focuses on developing CCPs beyond project level and jurisdictional approaches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |

| 214 | Seoyi Kim            | Part 1: Introduction | ge              | As carbon markets under the Paris Agreement operate under the countries' NDC context, the requirements to demonstrate the unit quality need innovative approaches that address uncertainties of the methodologies used under the CDM, facilitate faster and more inclusive market access, and ensure the credibility of markets. As markets under the Paris Agreement are expected to support increasing the ambition of countries' climate action, approaches should take NDCs, long-term strategies (LTSs), and their baselines into consideration. Accordingly, the approaches that rely on stringency of NDCs and how the targets are set under NDCs should be considered. Recognizing that the methodologies to validate the stringency of NDCs and LTSs are still evolving, the MDB WG proposes a phased approach to demonstrate the environmental integrity - where feasible to establish the stringency of the climate plans, it is sufficient to perform the corresponding adjustments to demonstrate the integrity; where not feasible, the same can be achieved through both stringent or conservative baselines and corresponding adjustments. Importantly, the MDBs plan to increase their support to LTSs that lead to net-zero or net-negative targets by certain deadlines and ensures that such support also takes care of environmental integrity considerations. In addition, countries should be encouraged to develop positive lists, benchmarks and standardized baselines. Approaches that rely on financial aspects of the projects and barriers they face are highly subjective and hence should be prioritized less. | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | 2.Requirements on transition towards net-zero emissions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | In relation to the comment provided in #1, having a separate requirement that the mitigation activity uses a technology or practice that is transformational and consistent with a net-zero emissions goal by mid-century is not supportive of the way countries increase their ambitions through carbon markets under the Paris Agreement. Countries have different mitigation options that have different cost, and implementing every mitigation option counts in achieving the country's NDC and beyond (LTS). Moreover, majority of countries have not yet set up their targets/goals consistent with a net zero emissions goal under an LTS. In that sense, approaches that rely on stringency of NDCs and how the targets are set under NDCs are more desirable and effective in catalyzing climate actions and investments and ensuring integrity of the overall carbon markets. Detailed requirements of the eligible mitigation activity laid out in the draft CCP only put excessive policing, which may dampen the market unnecessarily. It is important that new systems and approaches support increasing the transparency to create value first and facilitate learning by doing. Information such as the type of mitigation, technology, practice, and sectors of the underlying mitigation activity, however, is what buyers would be interested in and have different preferences for. Therefore, it is important to transparently disclose such information, and, for example, the Climate Warehouse data taxonomy is designed to support that.                                                                             | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | 3.Permanence                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | The MDB WG considers that the CCP requirements on permanence are too detailed, which limits innovation in this space, and it is largely based on common misconceptions regarding non-permanence risk.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |

| 214 | Seoyi Kim            | Part 1: Introduction | ge              | Regarding the requirements on the degree of reversal risk, it is assumed that any mitigation activity related to the management of carbon stocks has a material risk of reversals, and that projects that would lead to a lower demand of fossil fuel have a zero risk. However, as experience shows with recent trends, the fossil fuels that were saved and left in the ground, could be extracted again in the future if economic conditions are adequate for it (e.g., electricity prices), reverting the mitigation process. This is not different from a jurisdictional REDD+ program where the carbon saved could be released in the future if economic conditions make this to be favorable (e.g., commodity prices). Therefore, we would suggest revisiting the concept of non-permanence and looking at this with a different perspective.                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | The assessment framework provides two recommended approaches for addressing non-permanence risk, which are prescriptive, not backed by science, and limit the possibility of using other approaches and options. On the requirements on monitoring and compensation for reversals approaches, requirements are applicable to any kind of intervention regardless of the inherent risk of the intervention, which is incorrect. A large-scale jurisdictional program or a national policy to increase use of wood harvested products might not have the risks that exist in a small-scale Afforestation/Reforestation project, but all these are conflated. Moreover, the commitment to monitor and compensate reversals for more than 50-100 years would not justify the actual risk of reversals and would be extremely costly, making unfeasible for projects to generate emission reduction credits. On the use of temporary crediting, this approach was proposed under the CDM, but it was demonstrated that there are more pragmatic approaches, and that this represents a very significant barrier for scaling up of markets as these temporary units would not be fungible with other units. | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | GHG Programs and Standards have followed science-backed robust processes to define the approaches to manage reversals at GHG Program level, and there should be more trust on these processes, instead of prescribing approaches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |

| 214 | Seoyi Kim            | Part 1: Introduction | ge              | The MDB WG considers that ensuring a high level of security for the marketplace will only increase trust in the market. Therefore, any new technology (e.g., digital) increasing the safety, reliance, and transparency of the MRV process should be welcome. The draft CCPs do not mention the use of new technologies to support monitoring, reporting, and verification (MRV) processes for projects under the standard, nor the need for programs to update protocols and methodologies to accommodate new solutions. While not a requirement for a program to be eligible, the draft CCPs could reference the need for eligible programs to move in this direction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | In terms of quantification, there is a problematic requirement from the assessment framework that overlays the use of conservative methods over accurate and most precise approaches, which undermines the efforts of programs and projects to make progress towards improving MRV methods. Therefore, care should be taken when relating conservativeness versus accuracy to ensure that programs and projects use the best available methods and approaches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | Also, in terms of rules for accounting carbon credits inside REDD+ jurisdictional programs, it is important to clarify that the rules for nesting are often defined by sovereign governments, and projects and programs need to comply with them. Therefore, rather than requiring having specific procedures in place for aligning baselines at the standard level, the standards should look at how projects/programs are aware of their responsibilities to comply with the local legislation, and such compliance should be validated and verified by third-party entities, which is currently the normal approach under most internationally recognized standards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | 5.Infrastructure for transparency and addressing double counting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | While registries are critical to record and track mitigation activities and carbon credits issued, communication between different program registries is essential to prevent double counting as it enables verification of the history of transactions and modifications made to the projects and credits. The draft CCPs, however, focus only on the former – carbon crediting programs having a registry, but not on the latter – the need for such registries to communicate with each other, which can be supported through use of common data formats and taxonomy in the different programs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |

| 214 | Seoyi Kim            | Part 1: Introduction | ge              | The Climate Warehouse, a global public meta-data layer that is designed to support transparency of markets, has developed such data model through consultations with multiple stakeholders over the past three years. The initiative also provides minimum functionalities and technical specification of a robust registry. The draft CCPs would benefit from incorporating outcomes of the initiative into their registry requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | Also, the assessment framework includes several requirements that seem to be more applicable to end-users (buyers of credits) than projects/programs. For instance, assessing the provisions towards the transition to net-zero emissions, the use of proceeds from issued carbon credits and tracking of funds, and overseeing the chain of custody after credits are issued, are all issues that go beyond the scope of carbon Standards. Therefore, if approved, this requirement will be very difficult (if not impossible) and costly to be achieved.                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | 6.Attributes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | In relation to the comment provided in #5, attributes are useful to describe and differentiate emission reductions and are included in the common data taxonomy developed under the Climate Warehouse. Based on the experience with the Climate Warehouse, however, it is important that the attributes that are considered are properly recognized, sufficiently incentivized and compensated. Efforts should be made to identify and enable simple solutions to support monitoring and tracking of identified attributes to consider the attributes that are easy to track, do not put additional burden on project developers, and are directly attributable to the project operation.                                                                                                                                                                                                                                                                                                                           | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | 7.Sustainable development (SD) net positive impact                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 214 | Seoyi Kim            | Part 1: Introduction | ge              | The balance needs to be maintained between the requirements for standards to ensure net positive SD impacts and for ensuring robust environmental and social safeguards. While ensuring net positive SD impact is desirable, having it as an additional attribute like the way the draft suggests (in #12.2 quantified SDG impacts) may be sufficient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 215 | Polly Thompson       | Part 1: Introduction | ge              | Sylvera are highly supportive of the aims of the Integrity Council and value the emphasis and interest being placed on credit quality and integrity of VCMs. In general we agree with the CCPs as key areas of focus to identify credit quality, and note that there is a huge amount of overlap between the CCPs and our own carbon credit ratings methodology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | See above       |
| 215 | Polly Thompson       | Part 1: Introduction | ge              | However, the implementation of the CCPs currently proposed in the AF and AP may present significant operational challenges. We are concerned that the current stringency of criteria will exclude all credits, potentially damaging confidence in VCMs and having the opposite effect to the intended scaling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 215 | Polly Thompson       | Part 1: Introduction | ge              | As a carbon credit ratings agency, we understand the challenges of performing reliable and fair assessments of credit quality. We assess credit quality at a project-level. These assessments have demonstrated huge variability in quality between projects from the same standards and methodologies. In developing frameworks for different credit types we have also become aware that different project types require significantly different approaches in order to assess key aspects of quality (such as carbon quantification, additionality, and permanence). We are therefore concerned that the IC-VCM's intent to create universal criteria to apply at a standard and credit type-level may not be sufficient to identify quality and exclude the opposite. Instead, we would support a more sector-specific approach, where the key considerations, and common pitfalls, for each sector are identified and the programme assessed on how it considers these factors for its relevant methodologies. | 0               |
| 215 | Polly Thompson       | Part 1: Introduction | ge              | Furthermore, we urge the IC-VCM to further consider work that has previously been done to improve standards and safeguards in the VCMs. For example, the Cancun safeguards are a result of a collaborative, international process with diverse key stakeholders such as Indigenous Peoples and host countries. The relevant aspects of the Cancun Safeguards could be a model for Environmental and Social Safeguards, and could be adapted for different sectors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 215 | Polly Thompson       | Part 1: Introduction | ge              | Furthermore, the Integrity Council may wish to consider if any aspects of its current scope are already being performed well by other market participants and whether narrowing its scope to address more specific issues may help deal with some of the potential operational challenges the Council may face.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |

| 215 | Polly Thompson       | Part 1: Introduction | ge              | Based on discussions we have participated in during the consultation process, it seems possible that the AF and AP may change significantly in response to feedback. If this is the case, we would support a second consultation period to give market participants the opportunity to feedback on this initiative which may have significant impacts on the wider markets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 216 | Barbara Haya         | Part 1: Introduction | ge              | Dear ICVCM expert committee and board,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | – The CCP assessment framework has many elements of a solid approach. The CCP stamp should be reserved for credits that are conservatively not over-credited and confidently not associated with harm. For the CCPs to have a strong influence to create a quality market, the CCP stamp must be trusted by buyers, and this will encourage registries to amend their protocols to receive the stamp. In the below I recommend specific ways to improve the proposed assessment framework to achieve this goal. |
| 216 | Barbara Haya         | Part 1: Introduction | ge              | Thank you for all of your hard work creating the proposed CCP criteria and assessment framework. Your goal – “to provide a credible, rigorous, and readily accessible means of identifying high-quality carbon credits that create real, additional and verifiable climate impact with high environmental and social integrity” – could not be more important.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | – The assessment framework should be made more detailed to lessen the subjectivity involved in making some of the assessments.                                                                                                                                                                                                                                                                                                                                                                                  |
| 216 | Barbara Haya         | Part 1: Introduction | ge              | I am a research fellow at the Goldman School of Public Policy and the University of California, Berkeley, where I run the Berkeley Carbon Trading Project. I’ve studied offset quality for over twenty years, and over the years have studied the outcomes of the Clean Development Mechanism, California’s compliance offset program, and various voluntary offset market project types.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | – To succeed in promoting a quality market, one in which credits with the CCP stamp can be trusted to represent their claimed climate benefit and not cause harm, the project type assessments will need to be carried out by teams of individuals without interest in the outcomes of the assessment and with the necessary sectoral, regional, and interdisciplinary expertise. Resources should be made available for this level of analysis.                                                                |
| 216 | Barbara Haya         | Part 1: Introduction | ge              | I strongly support many elements of the proposed framework and suggest several ways that it can be, and I believe it must be, strengthened to achieve its goals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | – Assessments should start with a summary of relevant published literature. For complex areas, someone with technical, regional, or sectoral expertise should conduct the literature review. Each project type assessment should include a summary of published literature and a description of how that literature was taken into account in the CCP review.                                                                                                                                                   |
| 216 | Barbara Haya         | Part 1: Introduction | ge              | I agree that quality assessments should be performed at the project type level defined as all or subsets of projects under a protocol. Since quality is affected by the detailed methods used to estimate emissions reductions, the assessments need to be of the specific and detailed rules used by each protocol. Since inevitably a set of quantification rules will lead to over-crediting by some projects and under-crediting by others, and since it is hard for program administrators or verifiers to distinguish which are which, analysis at the protocol or sub-protocol level, as you propose, is the right level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | – Assessments should be updated as relevant literature is published.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 216 | Barbara Haya         | Part 1: Introduction | ge              | I also agree with the attention placed on uncertainty. Given the inherent uncertainty with estimating true emissions reductions/removals against a counterfactual scenario that never happened and so is not directly measurable, an approach that recognizes uncertainty and treats uncertainty conservatively is needed to ensure quality and trust in the resulting credits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | – Independent audits of offset projects by type should be performed ex post on how the protocols are implemented in practice and CCP assessments should be updated as needed to patch loopholes and ensure quality.                                                                                                                                                                                                                                                                                             |
| 216 | Barbara Haya         | Part 1: Introduction | ge              | I also strongly agree with reserving the CCP stamp for credits that are conservatively not over-credited and confidently not associated with harm. Since most project types on the voluntary carbon market today are over-credited, there certainly will be pressure to weaken the CCP assessment framework to allow more project types to use the CCP stamp. It is important not to weaken the standards to accommodate more projects. Reserving the CCP stamp for credits that conservatively represent the claimed reductions and confidently do not cause harm is necessary for the CCP stamp to retain its meaning and to play a critical role in creating a part of the offset market with trusted quality credits. If the CCP stamp is placed on credits that research finds to be over-credited, trust will be lost in the stamp. If the CCP approach remains true to its stated purpose, it can create a quality bar that registries will seek to meet and that buyers can trust. Currently very few credits will meet the CCP stamp. This means that registries will need to update their protocols to meet the CCP standard to receive the stamp. This is exactly what is needed to drive up quality and create a trusted market that trades in real emissions reductions. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 216 | Barbara Haya         | Part 1: Introduction | ge              | In the below I suggest a few specific ways that the CCP assessment framework can, and I believe must, be strengthened to ensure credit quality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 216 | Barbara Haya         | Part 1: Introduction | ge              | Importantly, to succeed in promoting a quality market, one in which credits with the CCP stamp can be trusted to represent their claimed climate benefit and not cause harm, the project type assessments will need to be carried out by teams of individuals without interest in the outcomes of the assessment, with the necessary sectoral, regional, and interdisciplinary expertise, and with the resources to perform the level of analysis/research needed to be successful.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 216 | Barbara Haya                       | Part 1: Introduction                                                                                       | ge              | Whether the CCP criteria and assessment framework will be successful at ensuring credit quality depends on how the assessments are carried out in practice. The proposal provides an approach that could achieve the goals but does not reasonably ensure that they will be achieved. The criteria are sound – additional, permanent, conservatively estimated – but all registries already use these same criteria and all have produced protocols that have resulted in very high rates of over-crediting across most offset protocols (see articles cited in the Berkeley Carbon Trading Project Repository of Articles on Offset Quality). Almost all protocols systematically over-credit by failing to effectively filter out or account for (with counterbalancing under-crediting) the participation of non-additional projects, and many also set baselines and emissions factors, or create sufficient flexibility in carbon accounting methods, that systematically over-credits.                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                               |
| 216 | Barbara Haya                       | Part 1: Introduction                                                                                       | ge              | The assessment framework is only incrementally better than the framework used by the registries. We see some important additions, such as the need to take into account international leakage (not just domestic leakage).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                               |
| 216 | Barbara Haya                       | Part 1: Introduction                                                                                       | ge              | The proposed assessment process to engage one or two experts to cover all project types in a single scope (e.g. waste, industrial processes) is insufficient for the complex and important task. Much more attention and expertise is needed. For example, please see this analysis of oxidation rates from landfill gas projects ( <a href="https://gspp.berkeley.edu/assets/uploads/page/Comments_to_CAR_on_US_LFG_protocol_v6-Delkash_and_Haya.pdf">https://gspp.berkeley.edu/assets/uploads/page/Comments_to_CAR_on_US_LFG_protocol_v6-Delkash_and_Haya.pdf</a> ) performed by a researcher with a PhD in environmental engineering that focused on landfill gas emissions; this level of expertise was needed for one technical part of the protocol assessment. We will soon release comprehensive studies of cookstoves offsets and IFM offsets (please check back soon (in the next few weeks to a month) at the publications section of the Berkeley Carbon Trading Project website. Each comprehensive study required substantial attention by a team with diverse expertise. This is the level of analysis that is needed for each project type. | 0                                                                                                                                                                                                                                                                                                                                               |

| 220 | Individual/employee, EarthXCG GmbH          | The draft CCPs and Assessment Framework have been developed based on recommendations from the Expert Panel | ge              | Therefore, it is our recommendation at EarthXCG that two or more information technology experts are added to the panel to ensure the necessary expertise is present to solve the challenges leveraging state of the art information technology.                                                                                                                                                                                                                                                                                                                                                                                         | Therefore, it is our recommendation at EarthXCG that two or more information technology experts are added to the panel to ensure the necessary expertise is present to solve the challenges leveraging state of the art information technology.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 221 | Individual/employee, The Nature Conservancy | The draft CCPs and Assessment Framework have been developed based on recommendations from the Expert Panel | ge              | Expert Judgment at the project level: While the Expert Panel approach may be appropriate in some contexts, it is questionable that the panel will have the expertise or the time availability to assess mitigation activities at the level of resolution needed to make informed decisions (i.e, the project level). For example, consider Afforestation and Reforestation: this mitigation activity includes everything from industrial timber owners planting highly profitable exotic species monocultures to a local NGO partnering with an indigenous group to replant native forest on land they have recently secured tenure to. | To be meaningful, the judgment would have to be applied at the level of individual projects, which sounds like a role better suited to VVBs. There may be some mitigation activities that are homogenous enough (particularly industrial sector mitigation activities) that it is feasible for the panel to make these decisions and that would be a welcome contribution to the VCM. However for some mitigation activity categories (including many nature based mitigation activities), perhaps the panel should declare them “context specific” and provide a decision tree or high level guidance that standards could mandate VVBs use to assess likelihood of additionality. |

| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | 1. The current draft of the ICVCM CCPs and the Assessment Framework address every aspect of carbon crediting including GHG crediting program governance, process and transparency and credit quality through fundamental criteria including additionality, robust quantification, non-permanence, safeguards, avoiding double counting, validation and verification, legal considerations, and registry operations. It also includes new concepts around Paris Agreement alignment. The consultation document is 140 pages of highly technical information and is only available in English. Global stakeholders including governments and Indigenous Peoples communities need more than two months to understand and evaluate the document and to draft and seek approval to submit for comments and recommendations. | 0                                                                                                                                                                      |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | 2. No information was offered to justify the rationale for the new thresholds being set. The ICVCM does not identify with any specificity the challenges currently being faced in the carbon market and how the proposed CCPs and Assessment Framework solve them. Supporting evidence regarding the science and evidence of effectiveness of proposed new approaches – including the options assessed - would also be helpful in understanding the recommendations.                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                      |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | 3. The Assessment Framework is highly subjective. Many of the provisions rely solely or heavily on the expert panel's judgement. It is unclear how conformance will be determined or if there will be consistent interpretation of the requirements by different assessors over time. Furthermore, it seems the expert panel decisions on highly technical matter across various sectors and geographies will override the decisions that have already been taken by crediting bodies through their own processes of stakeholder consultation and expert technical review. This will undermine the market entirely.                                                                                                                                                                                                    | 0                                                                                                                                                                      |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | 4. Only two webinars are being offered in a language other than English, and these have been identified for IPLC representatives. It would be helpful to have additional summaries or presentations in multiple languages for all stakeholders. In addition, these webinars are being offered less than 2 weeks before comments are due which does not provide time for reflection and commenting. A longer consultation period and additional webinars in multiple languages would permit greater engagement from governments.                                                                                                                                                                                                                                                                                        | 0                                                                                                                                                                      |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | 5. The BSI portal is cumbersome and will further hinder feedback from stakeholders around the globe who may not have access to a reliable internet connection. It is also unclear how comments that are not in English will be considered and even if the BSI portal supports the characters present in many alphabets of non-English languages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                                      |

| #   | Comment submitted by                                                 | Para/Fig/Table/Note                                                                                                         | Type of comment | Submitted comment                                                                                                                                                                                                                                                                      | Proposed change |
|-----|----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | 6. RECOMMENDATIONS: Given the importance of this process, we recommend:                                                                                                                                                                                                                | 0               |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | · The ICVCM clearly articulate the specific carbon market challenges that are being addressed as well as the underlying rationale for the proposed solution and evidence of the selection as the most effective option to address the concern.                                         | 0               |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | · The ICVCM should develop objective evaluation criteria, clear guidelines for interpretation of the criteria, and a focus on the current processes and procedures that crediting programs have in place to ensure quality rather than a re-assessment at the project / program level. | 0               |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | · The ICVCM should build on and recognize existing reviews and assessments, such as under ICAO, rather than devising a completely new and parallel process.                                                                                                                            | 0               |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | · The ICVCM should roadtest any proposed assessment framework for feasibility of application.                                                                                                                                                                                          | 0               |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | · Comments should be permitted to be submitted outside of the BSI portal and in multiple languages.                                                                                                                                                                                    | 0               |
| 226 | Individual/employee, Emergent, the coordinator of the LEAF Coalition | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | · A second consultation period should be conducted to share and solicit comments on the revisions from this current process. Perhaps this could be held at COP with translation in multiple languages to allow for greater participation and feedback from countries.                  | 0               |

| #   | Comment submitted by                            | Para/Fig/Table/Note                                                                                                         | Type of comment | Submitted comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Proposed change                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 227 | Individual/employee, The Nature Conservancy     | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | Suitability of existing standards and methodologies: The CCP guidelines have been developed without consideration against actual methodologies and projects. Our understanding is that the IC-VCM is currently "road-testing" these criteria; however, this information is critical for us to know before finalizing public comments. There should be another chance for public consultation after the road-test is complete.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | IC-VCM should commit to another round of public consultation after the road-test is complete, as this is integral to our understanding of the effectiveness and implementation of the proposed CCPs.                                                                                                                                                                                                                                                                                                                                     |
| 228 | Individual/employee, Rights and Resources Group | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | The complexity of this overall consultation process, reliance on the bsi form process, and the absence of timely translations of all available documents - let alone the inherent complexities of the CCPs, Assessment Framework and Assessment Procedure themselves -- greatly diminishes the value and potential of this exercise. Despite one-off language-specific webinar consultations that offer limited means of engagement, and assume that all potential contributors have access to appropriate technologies and bandwidth, the overall process appears to be designed for expert inputs only.                                                                                                                                                                                                                                                                                                                                                          | On the ground testing and validation of the proposed tools with local organizations and other targeted user groups would greatly enhance the validity and reliability of proposed actions and solutions.                                                                                                                                                                                                                                                                                                                                 |
| 229 | Darcy Jones                                     | The Integrity Council is running a public consultation on the draft CCPs, Assessment Framework and the Assessment Procedure | ge              | EDF wholeheartedly agrees with the IC-VCM that "It is particularly critical we hear from Indigenous Peoples and local communities, who are often among the most marginalised segments of the population." We note that, despite the IC-VCM's sentiment, there have been many alarming inequities in the public consultation process. The process has been inadequate in that it has been inequitable and inaccessible, particularly at this critical early stage in establishing the framework. For example, consultation documents were not made available in other languages until late in the consultation process; the IC-VCM IPLC workshops were conducted less than 2 weeks before the comment deadline; and perhaps most critically, two of three IPLC Board member seats still remain vacant, nearly a year since the IC-VCM Board was launched. Subsequently, the consultation process has not provided sufficient time and resources for IPLC responses. | IPLC engagement must be a priority for the IC-VCM, not an afterthought, that is thoughtfully considered and enabled at each step. In the future, at a minimum, materials should be made available in languages other than English at the same time as English-language materials are released; events and workshops tailored to IPLC audiences should be conducted with the same urgency and consideration as events intended for other stakeholder groups; and the IC-VCM should prioritize filling the vacant IPLC Board member seats. |
| 230 | Jose Lindo                                      | The draft CCPs: setting the foundations for high-quality carbon credits                                                     | ge              | I can understand a fairness in the search for the most appropriate technologies. However, it is very striking the lack of a greater commitment to them, especially emerging ones, when both from UNFCCC (Innovation Hub and Climate Chain Coalition) and UN Environment (Coalition for Digital Environmental Sustainability (CODES)) are giving them a clear relevance to accelerate climate ambition. I already pointed it out during the TSVCM but I comment again on the importance of the need for Digital to be a vital part of the foundations of the CCPs.                                                                                                                                                                                                                                                                                                                                                                                                  | Some ideas on the principles worked on in the Climate Chain Coalition that could support a slight improvement of this fundamental section: <a href="https://www.climatechaincoalition.io/charter">https://www.climatechaincoalition.io/charter</a>                                                                                                                                                                                                                                                                                       |

| 231 | Anonymous                                       | The draft CCPs: setting the foundations for high-quality carbon credits                                                     | te              | Some western US offsets look to change tree species range within their offset contract life. The above articles discuss this risk, timeline, and costs. Current offset review does not look at this data, and it should, as many offsets will have losses in excess of their buffer pools over the offset life. The "Estimating Welfare..." article outlines computer programs which could be used to assess the subject land's ability to sustain specific tree species into the future. Currently, the ecological parameters of tree species are not reviewed against climate projections.                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 232 | Aya Yamazaki                                    | The draft CCPs: setting the foundations for high-quality carbon credits                                                     | ge              | As I stated in my comments on the draft introduction, excessive consideration of additionality, development impacts, etc. are detrimental to the supply and, therefore, to the energy transition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Mention to the need to balance between securing enough amount of VCs and consideration of those other various elements, should be added.                                                                                                                                                                                                                                                                                                                                                                                                 |

| 233 | Anonymous                                  | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | Regarding the text "The draft CCPs also propose key attributes for tagging carbon credits. These attributes are designed to allow the market to classify credits so buyers can more readily identify credits that match their preferences. Carbon-crediting programs may tag specific carbon credits with relevant attributes, under the oversight of the Integrity Council."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Mention provisions for other tags such as that we have proposed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 233 | Anonymous                                  | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | We support the use of tagging of credits. In our overarching comments, and elsewhere in our detailed comments, we suggest a further tag which could be introduced being that of alignment with a national system such as a carbon tax                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 234 | Anonymous                                  | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | The definition of integrity in carbon markets and the CCPs should be focused on the integrity of the carbon reduction/removal/claim, with additional attributes helping to differentiate projects and credits in the market. Although noble aspirations and important goals to work towards, the burden of achieving the UN's SDGs should not be placed squarely on the shoulders of the VCM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | We suggest removing proposed provisions that include regulatory requirements that fall outside of the scope of carbon project activities. All credible offset project standards require compliance with existing applicable regulations and laws. Imposing regulatory requirements that exceed local regulations and that are in many cases not related to the underlying carbon mitigation activity falls well outside of the remit and scope of a carbon crediting programme.                                                                                                                                                                                                                                                                       |
| 235 | Individual/employee, Dorr Asset Management | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | Dorr Asset Management is a leading trader and market maker in environmental markets including voluntary carbon offsets as well as regulated carbon allowance markets trading across spot and derivatives markets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | We would submit that the foundational focus is in the wrong place. Carbon markets are only one piece of environmental markets. As we've commented prior and will continue to do throughout this document the focus needs to move towards conservation. Targeting purely carbon is misguided. Scaling it as a market will have, and arguably already is having, lots of unintended consequences. Our firm has a strong background in cross-asset relationships in global capital markets and the inter-market relationship is important to consider here. Carbon credits have more cross-asset relationships than everything other than money itself. Thus understanding these interrelationships is vital. This starting point does not achieve that. |
| 236 | Max DuBuisson                              | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | While sustainable development impacts and transitions to net zero emissions are crucial for global progress, it is entirely feasible to have high quality, high integrity carbon credits without imposing these additional layers of requirements. All that these requirements do is increase the costs of generating CCP-compliant carbon credits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Remove item 10, and restrict item 9 to focus on safeguards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 237 | Individual/employee, Finnwatch             | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | Transparency should be included as one of the principles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Registry -> Registry and transparent reporting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 238 | Ivan VALENCIA                              | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | Paris alignment – The CCPs introduce this topic lightly and even consider leaving it out as an option. GGGI believes that this is a central topic and should not be left out, not even for the initial threshold. Alignment with the Paris Agreement is essential if the VCM is to contribute to countries meeting their NDCs domestically, and if we want a system that acknowledges the efforts of the VCM in the accounting of NDCs. The CCPs need to make mention of the NDCs in several instances, because consistency with NDCs is key if we are going to make carbon accounting and Article 6 work for the Paris Agreement and its participating Parties. The Decisions in Glasgow provide important references and exhortations that should be taken into account by the VCM, and the CCPs should make a bigger effort in making reference to parts of these decisions 2/CMA.3 and 3/CMA.3.                               | Refer to comment on this section                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 238 | Ivan VALENCIA                              | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | Jurisdictional REDD – In several instances, the CCPs introduce further requirements beyond those introduced by the UNFCCC, particularly in terms of additionality. This is likely to make it even more difficult for countries to engage in jurisdictional REDD+ programs despite the efforts being made in more than a decade. We strongly discourage the introduction of these new requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 238 | Ivan VALENCIA                              | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | Compliance with national regulations on carbon market projects – We are concerned that this aspect is overlooked and not mentioned in many areas of the CCPs. Carbon crediting programs and Validation and Verification Bodies must ensure that compliance with national regulations on carbon market projects occurs with voluntary carbon market projects. Several countries regulate carbon accounting, methodologies for project design, carbon rights, public consultation, whereas other countries have restrictions on voluntary markets altogether. It is the duty of carbon market programs to map any conflicting requirements between programs methodologies and carbon market regulations in specific countries, to flag these both for developers, VVBs and purchasers. This is similar to airlines, that are obliged to meet specific requirements of each destination country and to indicate these to passengers. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 239 | Anonymous                                       | The draft CCPs: setting the foundations for high-quality carbon credits | te              | References to the opportunity for aligning with compliance mechanisms should be introduced. More specifically, these shall refer to Article 6 of the Paris Agreement and its rulebook adopted by the Glasgow Climate Pact. By a matter of fact, virtually all the ten introduced points may be seen as 'aligned' to Article 6, but this is not explicitly declared.                                                                                                                                                                                                                                                                                                                                                                                                                    | Point 10 should be edited as follows: "Transformation towards net zero emissions through higher ambition' promotion"                                                                                                                                                                                                                                                  |
| 239 | Anonymous                                       | The draft CCPs: setting the foundations for high-quality carbon credits | te              | Also, space shall be given to the need for promoting higher ambition (ideal element to promote demand of carbon credits).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | A new point 11 should be added: "Alignment to the rules of Article 6 of the Paris Agreement"                                                                                                                                                                                                                                                                          |
| 240 | Individual/employee, Conservation International | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | RE this section and the 10 principles:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Recommend separating demand versus supply considerations for quality to focus on supply side.                                                                                                                                                                                                                                                                         |
| 240 | Individual/employee, Conservation International | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | Organization of CCPs should recognize the interrelations between the many technical carbon requirements and focus on key attributes to assess projects/programs. It is also missing some principles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Recommend aggregating technical carbon considerations under carbon technical, which would include baselines, additionality, permanence, leakage, application of methodology.                                                                                                                                                                                          |
| 240 | Individual/employee, Conservation International | The draft CCPs: setting the foundations for high-quality carbon credits | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Recommend adding additional following core principles: community co-benefits and biodiversity/ecosystem services, project governance, MRV, and climate resilience. Given that climate change is happening now, donors and FIs are asking for climate risk vulnerabilities. These need to be designed from the beginning to minimize delivery risk for carbon credits. |
| 241 | Anonymous                                       | The draft CCPs: setting the foundations for high-quality carbon credits | te              | Part 1: Additionality is obviously an important criterion for high-quality offsets, but attention should be devoted to the conflict between an excessive focus on additionality on the one hand, and the ability of the carbon markets to support additional carbon benefit from lower-risk forests on the other.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Remove item 10. Further comments on the Additionality section of the CCPs are below.                                                                                                                                                                                                                                                                                  |
| 241 | Anonymous                                       | The draft CCPs: setting the foundations for high-quality carbon credits | te              | Part 10, while a worthy and important global goal, is not and cannot be the responsibility of any carbon credit program. It is outside the scope of the supply side of the VCM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0                                                                                                                                                                                                                                                                                                                                                                     |
| 242 | Anonymous                                       | The draft Assessment Framework: putting the CCPs into practice          | te              | Stop using the term "credit." It's becoming incredibly problematic globally to talk about carbon markets. Credits are used to set and issue allowable emission thresholds. That's a totally different thing from offset certificates. Offset certificates are not credits. A credit cannot be used to offset an emissions. The vernacular is becoming incredibly loose. Which is very problematic.                                                                                                                                                                                                                                                                                                                                                                                     | Only use the term "certificates." Never use the term "credit" anywhere in this document to refer to certificates.                                                                                                                                                                                                                                                     |
| 243 | Individual/employee, The Nature Conservancy     | The draft Assessment Framework: putting the CCPs into practice          | ge              | Limitations to reliance on expert judgment: Many of the criteria are very subjective, meaning that expert judgment could vary depending on which experts review the CCPs at the time. IC-VCM should seek some method of tracking this and noting where there is wide variation amongst experts, as this could be a potential issue that could easily fly under the radar. For example, on the topic of financial viability, there are several inputs that could modify the results of the IRR. If those steps/criteria are not part of a certification requirement but are only included in the Core Principles Assessment Framework, how will the results be validated/confirmed? Lastly, there are limited experts that can volunteer time and a great many methodologies to review. | IC-VCM should strongly consider hiring VVBs to ensure there are no bottlenecks with the reviews.                                                                                                                                                                                                                                                                      |
| 244 | Ivan VALENCIA                                   | The draft Assessment Framework: putting the CCPs into practice          | ge              | Applicability to existing projects, standards and methodologies – It is unclear how the CCPs can apply to existing projects, standards and methodologies given that they will most likely have to make changes in order to meet the initial thresholds. There should be a clear transition pathway, encouraging the transition, much as there is a transition of CDM projects to the Article 6,4 mechanism. Another example is the Gold Standard, which provided a pathway for existing CDM projects to gain that recognition                                                                                                                                                                                                                                                          | Refer to comment on this section                                                                                                                                                                                                                                                                                                                                      |
| 244 | Ivan VALENCIA                                   | The draft Assessment Framework: putting the CCPs into practice          | ge              | This is very important given that existing voluntary carbon market projects still have long crediting periods when they may generate credits, and if they are not covered by the CCP, they can become a loophole for environmental integrity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                     |
| 245 | Peter Hurrell                                   | The draft Assessment Framework: putting the CCPs into practice          | ed              | For example, for non-permanence the inherent risk is the degree of reversal risk. Where there is no inherent risk, there is no need for the carbon-crediting program to have provisions in place to address non-permanence, but where there is a significant inherent risk, robust provisions are needed, such as monitoring and compensation for reversals.                                                                                                                                                                                                                                                                                                                                                                                                                           | Again this highlights the need for the integrity council to maintain an insurance fund.                                                                                                                                                                                                                                                                               |

Credits are used to set and"                                                                                                                                                                                                                                                                                                                                                                         | We agree with the comment above. Credit is misleading and again, analogous to the energy industry and given that it is the EU's ambition that the VCM will eventually replace the ETS, together with the fact that there will be many different flavors and types of certificates it makes sense to refer to them as such.                                                                                                                                                                                                                                           |

| 246 | Peter Hurrell                               | The draft Assessment Framework: putting the CCPs into practice | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | The unit of carbon is metric tonnes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 246 | Peter Hurrell                               | The draft Assessment Framework: putting the CCPs into practice | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | The tradeable instrument produced by a CO2 removal or sequestration project is a certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 247 | Anonymous                                   | The draft Assessment Framework: putting the CCPs into practice | ge              | Many of the Core Carbon Principles (CCPs) (e.g., Program governance, Mitigation Activity Information, Sustainable Development Impacts and Safeguards, and Additionality) require that documentation is publicly available. However, it is unclear how documents should be provided and what exactly 'publicly available' means.                                                                                                                                                                                 | The Assessment Framework should clarify what is meant by 'publicly available' including whether they should be written for a non-technical audience. Furthermore, it would be useful to provide an example of a carbon-crediting program which exemplifies meeting this requirement.                                                                                                                                                                                                                                                                                 |
| 248 | Anonymous                                   | The draft Assessment Framework: putting the CCPs into practice | ge              | In general, we found that there is repetition across the Assessment Framework. For example, the Program Governance Core Carbon Principle has criteria for transparency and making program documents publicly available, and the Mitigation Activity Information Core Carbon Principle also has a criterion to make this documentation publicly available.                                                                                                                                                       | This repetition should be consolidated to make the Assessment Framework easier to understand and comply with.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 249 | Max DuBuisson                               | Carbon-crediting programs                                      | ge              | It is ridiculous for this exercise to extend to the level of methodologies, much less particular versions of methodologies. Any high quality methodology should be a living document, able to evolve and adapt according to lessons learned through implementation, as well as advances in relevant science and policies. Requiring application of the CCP at the level of individual methodologies (and versions of methodologies) will require significant resources and prove to be a bottleneck on the VCM. | Apply the CCPs at the program level, with the ability to screen out entire sectors, if necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 250 | Individual/employee, EarthXCG GmbH          | Carbon-crediting programs                                      | te              | It is our opinion at EarthXCG that the approach to standards needs to not only consider existing types of certifications developed over the past two decades, but really needs to comfortably embrace the advancements in information technology as a game-changer. Such capabilities can greatly enhance the levels of assurance needed at the most granular level of the value chain and thus support the credibility and transparency of all credit market activities that will rest upon it.                | It is our opinion at EarthXCG that the approach to standards needs to not only consider existing types of certifications developed over the past two decades, but really needs to comfortably embrace the advancements in information technology as a game-changer. Such capabilities can greatly enhance the levels of assurance needed at the most granular level of the value chain and thus support the credibility and transparency of all credit market activities that will rest upon it.                                                                     |
| 251 | Individual/employee, The Nature Conservancy | Carbon-crediting programs                                      | ge              | Focus of the assessment criteria: For many of the criteria, it's unclear what is being assessed. Sometimes the criteria apply to standard-wide requirements; others are specific to the methodology level, or even a project-specific level. More clarity is needed about what is being assessed, for each of the various criteria.                                                                                                                                                                             | We strongly recommend that assessment starts at the standard/methodology level, but must be followed by a separate assessment of individual projects, perhaps by accredited VVBs that can be trusted to use the CCP criteria. This way, IC-VCM will avoid disqualifying projects under methodologies that do not meet the criteria, even when the project does.                                                                                                                                                                                                      |
| 252 | Thomas Hämmerle                             | Carbon-crediting programs                                      | ge              | Focusing on and/or generating on methodologies and further seals of approval could be considered as option to fasten the implementation instead of individual organizations and their different programs.                                                                                                                                                                                                                                                                                                       | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

It was said "all types" in the sentence, however, it needs to be clear the separation between the type of nature-based credits vs. type of tech-based credits. Each of those can have different required time for the completion of assessment from every perspectives. It also needs to be mentioned how this effort will be managed, for instance how the risk of delay for the finalization of projects will be prevented for those invested to the voluntary carbon credits. |
| 256 | Aya Yamazaki                                | Credit types                                                   | ge              | 1) As for the draft note on use of carbon credits, the idea to limit it to residual emissions while naming its role just as complementary is not appropriate. In the transition period, carbon credits, both compliant and voluntary, are indispensable for Scope 1 and 2 emissions reduction as well. Please note that the linear reduction path per se as supposed by the SBTi Standard is not scientific, only 2050 net zero target being scientific.                                                        | 1) As for the use, mentions implying limiting it to Scope 3 should be all deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 256 | Aya Yamazaki                               | Credit types        | ge              | 2) The idea for the IC to assess programs/projects is controversial. At this stage I cannot support it. Governance and representation (region-wise, sector-wise, stakeholder-type-wise, etc.) of the assessing body should be made public before such consultation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 2) Proposal relating assessment by the IC should be deleted at this stage.                                                                                                                                                                                                                                                                                                                                           |
| 257 | Anonymous                                  | Credit types        | ge              | This level of assessment is entirely unworkable. For example, is a sector "renewable energy"; "Solar energy"; "grid-connected solar energy" or "grid-connected solar energy in LDCs"? All of these may have a different answer in terms of additionality. It is ludicrous to think the IC-VCM can determine sector-wide answers to questions that require a much more detailed level of assessment. This is NOT to encourage IC-VCM to go to that level, but rather to make clear that it does not make sense for an overall set of principles to get into sector-specific issues. This is the entire point of detailed methodologies, standards frameworks and project-specific validation and verification.                                                                                                                                                                                                                                            | IC-VCM should stay at the level of principles and governance, ensuring standards take the proper approach to setting requirements for all sectors, with adequate stakeholder (including scientific) review. If the IC-VCM wants to get into specifics of different sectors then it should start its own standard.                                                                                                    |
| 258 | Anonymous                                  | Credit types        | ge              | When talking about monitoring, how this process will take place? timeline? what happens if programs do not achieve full threshold requirements? what about after receiving the approval do they have to provide evidence of the credits along a certain period? will the CCP approved status retired? where will this be reflected. If this information is mentioned in the procedure, it will help to mentioned in the introduction                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Include more guidance on monitoring and consequences if requirements are not achieved.                                                                                                                                                                                                                                                                                                                               |

| 261 | Anonymous                                  | Credit types        | te              | With respect to the section "A note on the use of carbon credits", further to our previous comment on "tagging", we suggested that consideration could be given to an additional tagging for credits that have been approved, for example, for use in a national carbon tax programme.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Add additional tag for credits that have been approved for use in national mitigation instruments                                                                                                                                                                                                                                                                                                                    |
| 262 | Anonymous                                  | Credit types        | te              | Regarding the section "A clear pathway for continual improvement", please see our overarching comments on the use of the "initial" and "full" thresholds. As indicated there, it is our view that even the "initial" ICVCM thresholds will represent a significant administrative burden, particularly to smaller carbon crediting programs, including those in developing countries. We recommend that these are revised to ensure that they do not end up causing an unintended outcome of shrinking the market and generating more uncertainty. Furthermore, we do not consider it appropriate at this stage to set the "full" thresholds. Crediting programmes cannot be expected at this stage to commit to some future state (with unclear timelines) given the global uncertainty about how the markets may evolve. Rather, any ratchet mechanism on the ICVCM needs to be done through a consultative process, beginning in, say, 5 years' time. | Drop the "full" threshold at this stage                                                                                                                                                                                                                                                                                                                                                                              |
| 263 | Anonymous                                  | Credit types        | ge              | We are generally concerned about the length of time the Integrity Council will need to complete the Assessment of the various programs, methodologies, project types, science, and data as proposed. A long lead time to implement and complete the assessment will leave the market in a period of uncertainty – prompting many participants to take a 'wait and see' approach – reducing transactions and investment into new projects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Make a long term-plan to make improvements to specific segments or sections of the market rather than tackling the whole market all at once. Also focus on the existing programs and do not attempt to review methodologies and projects. The science, data and knowledge that goes into each methodology is extensive and could not possibly be undertaken by the task-force, without the subject matter expertise. |

An open source methodology that the industry recognizes and that any number of qualified certifiers could adopt and use would greatly speed up trust and consistent pricing.                                                                                                            |
| 265 | Anonymous                                  | Credit types        | ge              | Isn't it necessary to emphasize that the CCP is not a standard that defines "high quality" as a general use of credit or climate funds, but rather what is desirable when companies use it for "net zero claim"? A note on use of carbon credits on page 15 of the public comment document states "the drafts are based on the assumption that credits may be used by companies to compensate for residential emissions".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Throughout the text, the name "CCP" should be changed to "CCP for net zero claim."                                                                                                                                                                                                                                                                                                                                   |
| 266 | Eftimiya Salo                              | Credit types        | ge              | "Once the official documents are finalised and published, in order to be CCP-eligible in the immediate term, carbon crediting programs and credit types will have to meet the initial threshold and commit to meet the more stringent requirements in a timely manner."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Only projects which apply to the stringent requirements should be CCP-labeled. There should be a separate label for projects which only apply to the threshold criteria and have committed to achieve the stringent requirements as well, but have not yet done so. This will enhance transparency and avoid confusion for the buyers of the carbon credits.                                                         |
| 266 | Eftimiya Salo                              | Credit types        | ge              | Comment: CCP-eligibility for carbon projects that only comply with the initial threshold criteria, but not the stringent requirements could mislead corporate buyers into thinking that the project has complied also with the stringent requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 267 | Individual/employee, Finnwatch             | Credit types        | ge              | "A clear pathway for continual improvement" can be a useful concept, but there should be clear distinction between programs and credits that have fulfilled just the criteria for initial threshold and those that have fulfilled the full criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | n/a                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 269 | Individual/employee, Conservation International | Credit types        | te              | RE Section "A Flexible Approach" : Please define what you mean by "Integrity Council will use a risk based approach for some criteria using a combination of different factors". Exactly what kind of risk-based approach will you use, how will you weight the risks, chose the right type of statistical curve etc? Do you have risk management professional who know how to do this and to adapt traditional risk management RAROC approaches that the market uses for Natural Climate Solutions (NCS) risks. It requires both risk management and NCCS knowledge—skillsets which are rarely found together in the same person.. Finding both in one person is like finding a unicorn.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Please provide more details on risk based approach methodology. Also, all significant risks should be subject to a risk based approach, not just a few if a proper risk management approach that will have market credibility is to be followed. A risk based approach necessitates properly identifying and weighting individual project/program risk buckets as per project context. Who will do this as it will require building highly technical and rare skill sets that are not only rate to find, but also expensive.                          |
| 269 | Individual/employee, Conservation International | Credit types        | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | For permanence risk it is recommended that that good governance and MRV be added to the CCPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 270 | Individual/employee, Conservation International | Credit types        | ge              | Paris Alignment for corresponding adjustments not within the parameters of quality, but is a bigger global and sovereign policy issue. Also, most countries are not advanced enough on it yet to come up with anything meaningful.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 271 | Individual/employee, Conservation International | Credit types        | ge              | RE "The Draft Assessment Procedure" Section: "Integrity Council will assess methodologies for credit types in several parallel streams." This is not the role of IC-VCM to second guess individual carbon standard methodologies. This will cause lack of faith in carbon standard methodologies in general and create significant investor project risk which will create disincentives for investment if a project developer/investor cannot be certain that once certified by a carbon standard, their use of methodology is still not accepted, is questionable by IC-VCM, and could be invalidated. This will significantly hurt market development. It will kill market confidence in the carbon standards and carbon market along with it. Also, how will IC-VCM get enough volume of staff for needed expertise? NCS methodology personnel are very hard to find these days and quite expensivecurrently few and in high demand. What IC-VCM is proposing will require building a large methodology team, which is not realistic in current market and hiring conditions. This will create backlog and slow down projects, in addition to adding to market uncertainty. It also gives IC-VCM too much power. | Recommend that Integrity Council not review individual methodologies. Assessing carbon standards is acceptable and feasible, but no individual methodology reviews.                                                                                                                                                                                                                                                                                                                                                                                   |
| 272 | Individual/employee, Climate Connect            | Credit types        | te              | The use of carbon credits is mentioned to be used for offset of residual emissions only, without differentiating if the credits being used in developing or developed countries or by large or small enterprises                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Use of carbon credits allowed for offsetting should also mention if offsets for both regular emissions and residual emissions from developing economies and small enterprises are suggested to be allowed                                                                                                                                                                                                                                                                                                                                             |
| 273 | Individual/employee, Climate Connect            | Credit types        | te              | The buyers provide weightage to the vintage of the credits and this would be an important information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Include the vintage as a criteria for defining the types of carbon credits. Would be useful particularly for CORSIA                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 274 | Luzia Bieri                                     | Credit types        | ge              | We welcome the work of the IC-VCM and are supportive of its mandate to create a set of universally applicable core carbon principles that signal integrity in voluntary markets. Nevertheless, we are concerned about the level of detail and the practicability of the proposed approach.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | We recommend shifting towards an assessment at the crediting program level, especially for additionality (AF, section 8), permanence (AF, section 9) and robust quantification (AF, section 2 & 10).                                                                                                                                                                                                                                                                                                                                                  |

| 276 | Individual/employee, EarthXCG GmbH          | Credit types        | te              | It is our opinion at EarthXCG that there should be a standardized set of meta data associated with every individual carbon credit and that the data, where possible, be gathered by sensors and machine analysed. The meta data should have a minimum requirement of attributes plus allow for inclusion of more nuanced credit attributes to improve pricing information. For example, an individual carbon certificate meta data set might look like: [1 mT CO2R, DAC Climeworks, Iceland, Orca, fan #14, filter #07, transport pipe #09, run-time, date stamp, three sensor data analytics, sequestered limestone Carbfix, Iceland, verification EarthXCG, credit unique ID #EXCGCW140609162520220614CF000001]. | It is our opinion at EarthXCG that there should be a standardized set of meta data associated with every individual carbon credit and that the data, where possible, be gathered by sensors and machine analysed. The meta data should have a minimum requirement of attributes plus allow for inclusion of more nuanced credit attributes to improve pricing information. For example, an individual carbon certificate meta data set might look like: [1 mT CO2R, DAC Climeworks, Iceland, Orca, fan #14, filter #07, transport pipe #09, run-time, date stamp, three sensor data analytics, sequestered limestone Carbfix, Iceland, verification EarthXCG, credit unique ID #EXCGCW140609162520220614CF000001]. |

| 282 | Individual/employee, EarthXCG GmbH          | Credit types        | ge              | It is our opinion at EarthXCG that the issue of permanence reversal will not be relevant to all carbon certificate programs (carbon-credit programs) as some programs will not be producing any credits where mitigation attributes are not definitive at the time of creating the carbon certificates (credits). For example, if the standardized set of meta data associated with every individual carbon credit includes attributes linked to sequestration and reuse, the resulting carbon certificates (credits) meta data will capture the true nature of environmental impact and will not require. If they are only issued ex-post, then in this case it would not be relevant.                            | It is our opinion at EarthXCG that the issue of permanence reversal will not be relevant to all carbon certificate programs (carbon-credit programs) as some programs will not be producing any credits where mitigation attributes are not definitive at the time of creating the carbon certificates (credits). | 283 | Thomas Hämmerle                             | Credit types        | ge              | Even though, many carbon credit program will comply with thresholds, there will be some who does not. The IC-VCM should in this case look for an exchange with the provider and use a transition period. In practical, there could be a common defined transition time, where the adaption takes place and in the best case does not disturb the market or trust. If after the defined transition time, the program is not inherently with the program, there should be sanctions. Regardless of the implementation, this issue should be handled very sensitively in order not to endanger the trustworthiness of the entire sector.                                                                              | · Permanence                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 284 | Anonymous            | Credit types        | ge              | At this stage, suggesting a two-tier process is inappropriate given how difficult it will be for many issuers to reach even the "initial" threshold. Any further ratcheting of requirements should only take place after a significant period and should involve a different process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | The ICVCM should limit itself to program-level assessment. It should also think carefully about the effect its plans will have on the market it is trying to scale and catalyze.                                                                                                                                                                                            |
| 284 | Anonymous            | Credit types        | ge              | The level of analysis proposed in the document is unworkable at the ICVCM level, given its broad view. It would require a huge methodology team, whose entire job would be to duplicate work previously done by actual methodology experts. Credit types differ widely on a very granular level. The ICVCM should focus at the level of the registry and its governance processes, not attempt to dig deeply into every certificate type and methodology (which have already been through rigorous processes and reviews with significant governance and oversight mechanisms).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0                                                                                                                                                                                                                                                                                                                                                                           |
| 284 | Anonymous            | Credit types        | ge              | The ICVCM should also give some thought to transition risks (i.e. the period between when it announces the adoption of these principles and when it approves a particular credit type). This can freeze investment if not handled well. It is also worth noting that while the ICVCM calls its approach "flexible," it is very clearly anything but.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                                                                                                                                                                                                                                           |
| 285 | Barbara Haya         | Credit types        | ge              | On JREDD+ specifically                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | JREDD+ should not be considered as eligible for receiving a CCP stamp. This is due to the challenges of ensuring harm is not caused by a jurisdictional REDD+ program given the high risk of harm and limited effectiveness of safeguards alone in preventing harm, and the challenges of ensure that JREDD+ credits represent real, additional, and permanence reductions. |
| 285 | Barbara Haya         | Credit types        | ge              | The proposed CCP assessment framework and process contemplates ways to accommodate assessing jurisdictional programs against the CCP standard. The standard aims to assess whether credits can be confidently treated as equivalent to reducing fossil fuel emissions and be tradable with those emissions to meet a carbon target or claim carbon neutrality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                                                                                                                                                                                                                                                                           |
| 285 | Barbara Haya         | Credit types        | ge              | Jurisdictional REDD+ standards (e.g. ART TREES, VCS JNR) are unable to meet the CCP standard to be considered as offsets and should not be considered eligible for the CCP stamp. Individual jurisdictional programs can be very worthwhile supporting, but a standard, like ART TREES, is unable to "see" whether jurisdictional REDD+ programs meet the CCP criteria. The information needed to assess whether a jurisdictional REDD+ program does not cause harm and meaningfully addresses the drivers of deforestation for long-term (permanent) forest conservation needs deep grounded knowledge of the particular jurisdictional program. The proposed assessment framework does not, and is unable to, require that standards use the levels of knowledge to make expert assessments. The jurisdictional standard, e.g. ART TREES, creates a set of standards that can be verified by a third-party verifier. A third-party verification system is structured to assess a project against an objective set of criteria. The CCPs, one step above the jurisdictional standard, will have a hard time assessing whether a jurisdictional standard effectively "sees" whether proposed jurisdictional programs effectively and permanently address the drivers of deforestation in the particular context and have low risk of harm. | 0                                                                                                                                                                                                                                                                                                                                                                           |
| 285 | Barbara Haya         | Credit types        | ge              | Safeguards – REDD+ (project based and jurisdictional) involves high risk of harm. This is evidenced by a large literature on REDD+ projects that have caused harm. Many if not most case studies of REDD+ projects (REDD-readiness, pilot projects, results based payments, and offset projects) document some level of harm, from fomenting tension within a forest community, to restricting communities from their traditional use of forests, to displacement of villages, to violent suppression protest. The types of activities incorporated into project-based REDD+ programs are many of the same types of activities used by existing and proposed jurisdictional programs, such as the establishment of conservation areas, alternative livelihood programs, and land use restrictions. This literature strongly shows that REDD+ projects have a high risk of harm.                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0                                                                                                                                                                                                                                                                                                                                                                           |
| 285 | Barbara Haya         | Credit types        | ge              | Studies on safeguard standards show that the safeguard standards proposed by the CCP framework can help reduce the risk of harm, especially of the most egregious abuses, but are insufficient to ensure harm is avoided. The reason is that it is hard for a third party verifier to know whether safeguard requirements were carried out fully or superficially.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0                                                                                                                                                                                                                                                                                                                                                                           |

| 285 | Barbara Haya          | Credit types                   | ge              | Drivers of deforestation – Global Forest Watch data on deforestation rates shows high levels of variability year-to-year in deforestation rates across sub-national and national governments. These are due to actions taken by governments as well as exogenous factors such as changes in commodity prices and international supply chains. This means there is a high risk of hot air, at least in the first years of a jurisdictional REDD+ programs -- reductions caused by exogenous factors or by existing policies can be credited. Since jurisdictions are much larger than project lands, even a small amount of leniency in the baseline can lead to a large quantity of hot air.                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                                                                                           |
| 285 | Barbara Haya          | Credit types                   | ge              | The goal of jurisdictional REDD+ is to support governments in implementing policies and programs that effectively reduce deforestation. But in order for JREDD+ to receive the CCP stamp, there needs to be confidence that the offset program causes the reductions, and that the program addresses drivers of deforestation in a way that is sustained (permanent) over time. Like with safeguards, the level of on-the-ground knowledge that is needed to assess whether a jurisdictional program addresses the drivers of deforestation in a meaningful and lasting way cannot be written into a standard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                                                                                                                                                                                                                           |
| 285 | Barbara Haya          | Credit types                   | ge              | Permanence: It is also unclear how jurisdictional REDD+ programs can meet the CCP permanence requirement since regimes can change and undo policies or reverse trends without recourse.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                                                                           |
| 285 | Barbara Haya          | Credit types                   | ge              | The challenges of ensuring harm is not caused by a jurisdictional REDD+ program and that the credits represent real, additional, and permanence reductions means that JREDD+ should not be considered as eligible for receiving a CCP stamp.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                                                                                           |
| 286 | Barbara Haya          | Credit types                   | te              | I agree that quality assessments should be performed at the project type level defined as all or subsets of projects under a protocol. Since quality is affected by the detailed methods used to estimate emissions reductions, the assessments need to be of the specific and detailed rules used by each protocol. Since inevitably a set of quantification rules will lead to over-crediting by some projects and under-crediting by others, and since it is hard for program administrators or verifiers to distinguish which are which, analysis at the protocol or sub-protocol level, as you propose, is the right level.                                                                                                                                                                                                                                                                                                                                                                                                                                                           | I agree that quality assessments should focus on project types a you defined project types.                                                                                                                                                                                                                                 |
| 287 | Anonymous             | Part 2: Core Carbon Principles | ge              | There need to be raised concerns to the question of ex-ante or only ex-post credit. If post credit will be the only eligible credit, after the proof of the GHG emission reductions or removals. This will prevent a vast number of development project to happen. In development economies founding is next to impossible, environmental project will not happen with out credit. The concept of VCM is to enable GHG emission reductions or removals development projects. Finding investors pre the project, has been harder that the process of getting credit validated and verified. In the East and Central African regions, all projects are fully relying on credit to initiate the projects.                                                                                                                                                                                                                                                                                                                                                                                     | The principles most direct the pathway for development projects in the low economy regions to be founded by the carbon credit. This is inline with the purpose of enabling project which without carbon credit will not happen. Rules for reversal and insurance hereof must be set for fully transparency and reliability. |
| 288 | Calvin Tran           | Part 2: Core Carbon Principles | ge              | Generally we are supportive of the IC-VCM and its Core Carbon Principles. Getting this right will improve the pipeline of high-quality carbon projects and carbon credits and increase the throughput for the financing needed to truly scale the VCM. The quality of carbon credits is critical to the voluntary carbon market achieving its climate mitigation goals - rather than delaying climate action - and the CCPs correctly outline weaknesses that have been raised by skeptics of offset projects. However, while we support the CCPs and its normative spirit for higher integrity, we recognize that the devil is in the details, and that a poorly-designed procedural process can bludgeon the ambitions of the CCPs. To this end, we hope the IC-VCM and its Expert Panel consider all the comments provided in this process in earnest, and we hope that a better-refined version of the Assessment Framework comes into fruition from this initial public commenting period. We look forward to reviewing and commenting on a second draft of the Assessment Framework. | -                                                                                                                                                                                                                                                                                                                           |

| 291 | Anonymous                       | Part 2: Core Carbon Principles | ge              | The IC-VCM must create a threshold standard that can be seamlessly applied today, in order to create confidence in the market without further delay. This should be based on an initial threshold requirement that reflects current best practice in the market. We believe the best way to improve integrity in the market is to start with a threshold that is achievable by leading programmes within reasonable timeframes, such as those endorsed by ICROA and the independent crediting programs approved by ICAO.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 291 | Anonymous                       | Part 2: Core Carbon Principles | ge              | This should be followed by a mechanism to ratchet up the requirements over time backed by science, experience gained with the practical application of the threshold standard, and respectful of the governance processes of the existing programmes. This new approach is laid out in comments under Assessment Procedure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 291 | Anonymous                       | Part 2: Core Carbon Principles | ge              | The dangers of the extensive requirements as laid out in the current proposal are two-fold: crediting programmes and active proponents may not apply for CCP assessment thereby rendering the standard moot. Secondly, the monitoring and governance systems required to enforce these criteria require tremendous resources and pose a potential multi-year bottle neck in bringing CCP units to market. This will effectively slow down investment flows to climate mitigation activities at a time when we need to accelerate our actions to stay within global temperature limits of 1.5°C.                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |

| 291 | Anonymous                       | Part 2: Core Carbon Principles | ge              | Our organization proposes that the IC-VCM adopt a mechanism to ensure continuous improvement of the CCP and Assessment Framework over time, without defining that future state today. A ratchet mechanism would ensure that new advancements and best practice can be reflected in the CCPs rather than pre-defining full threshold requirements today that may not meet quality requirements in the future market or that programmes cannot commit to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |

| 292 | Anonymous                       | Part 2: Core Carbon Principles | ge              | One of the CCPs is 'no double counting'. What is ICVCM's position on double claiming (or double usage) when reducing scope 3 emissions? If there is a reduction on the land of a farmer who is in the value chain of several food corporates, then these food corporates can all claim that their scope 3 has decreased. Is that possible under this CCP?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 292 | Anonymous                       | Part 2: Core Carbon Principles | ge              | Authorisation for Article 6 purposes and 4. Adaptation co-benefits. The interaction with the Paris Agreement is still work in progress, we understand. Currently it is not very clear how that is supposed to work. The potential double counting issue remains present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |

| 294 | Individual/employee, Agreea ApS | Part 2: Core Carbon Principles | te              | As we are approaching the CCPs from the angle of nature-based solutions, in particular within agriculture, we are hoping to see more differentiation and clarity between the approach to assessing the different types of projects (nature-based solutions vs. technology-based solutions) within the CCPs. While projects and programmes are to closely adhere to the CCPs, as currently laid out, it is difficult to understand how the different elements of carbon programmes and associated methodologies could potentially be interlinked with the different solutions for carbon removals and emissions reductions. The existing methodological approaches to the main elements of high-quality carbon credits, i.e. additionality, permanence, monitoring, leakage, and carbon quantification will differ between the solutions (nature and technology). In this regard, we request that the CCPs outline specific project examples and how these will hypothetically be examined at the start of the assessment. | 0               |

| 295 | Individual/employee, Agreea ApS    | Part 2: Core Carbon Principles | te              | Agreea ApS: We believe that the focus on transparency and public consultation within the principles will force accountability for both new players entering the market as well as those that have already been operating for years. The CCPs dictate the publishing of project documents, methodologies, tools, and guidelines while also making the roles and responsibilities of those who oversee the program public. Globally recognized standards have public archives and data on projects in order to maintain transparency as well. We hope to see more clarity on how the CCPs wish to address and maintain compatibility with active projects that are running under existing globally accepted VCM standards and the documentation which is already made available on their public data platforms. | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 296 | Anonymous                          | Part 2: Core Carbon Principles | ge              | 1. These 10 Principles are comprehensive and reasonable. However, in the assessment, some of the thresholds are too stringent than the actual situation of the reduction project. Some of the assessment methods have not been established or not widely accepted, and some of the requirements are beyond the scope of responsibility of the project.                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 296 | Anonymous                          | Part 2: Core Carbon Principles | ge              | 2. Gap between Initial threshold and Full threshold is large. It is not clear when the project should transition to the full threshold.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 296 | Anonymous                          | Part 2: Core Carbon Principles | ge              | 3. Transition paths are diverse. How to make an objective judgment? There is a risk to be subjective value judgments and this principle seems to have different nature from other principle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 297 | Anonymous                          | Part 2: Core Carbon Principles | ge              | Requiring all 10 requirements to be fully filled will cut most of the programs out. When the requirements are so strict the voluntary carbon markets without ccp approval will stay more wild for longer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Better option to fully fill of all requirements would be some easy to reach starting, and possibility to develop stage for the starting programs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 298 | Individual/employee, EarthXCG GmbH | Part 2: Core Carbon Principles | ge              | It is our opinion at EarthXCG that independence of roles must be considered in terms of methodologies and incentives.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | It is our opinion at EarthXCG that independence of roles must be considered in terms of methodologies and incentives.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 298 | Individual/employee, EarthXCG GmbH | Part 2: Core Carbon Principles | ge              | An emissions mitigation project will almost certainly have a prima facie conflict of interest with the verification process (VVB). However, it is not always the case between the verification and the carbon certificate issuance (carbon-crediting program). Rather, it largely depends on the verification methodology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | An emissions mitigation project will almost certainly have a prima facie conflict of interest with the verification process (VVB). | 298 | Individual/employee, EarthXCG GmbH | Part 2: Core Carbon Principles | ge              | Alternatively, the verification body might not need to be separated from the carbon certificate issuing party if employing a superior methodology. For example, where the verification body utilizes automated sensor data collection and analytics, and makes the data publicly available for audit, then the automatic production of carbon certificates from the standard-attaining operations should be encouraged for its high-integrity, low cost, and scalability. This is the direction that information technology is driving every other industry. It will drive the emissions mitigation industry as well, so it is imperative that it be permitted and even encouraged within the standard.                                                                                                       | Alternatively, the verification body might not need to be separated from the carbon certificate issuing party if employing a superior methodology. | 299 | Vega Tapia                         | Part 2: Core Carbon Principles | ge              | Natural Climate Solutions have proved to be a powerful mechanism in managing climate change. Despite high integrity and positive impact from many NCS projects, meeting CCPs requirements can be very difficult to them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | We suggest to review criteria under the specificities of Natural Climate Solutions to promote natural carbon sinks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 300 | Oda Almas                          | Part 2: Core Carbon Principles | ge              | As the principles currently stand, they lack consistency in their phrasing: some tells the reader what should be required (e.g. no double counting), whereas others are just a word/heading indicating what the topic is (e.g. registry). Consistency is recommended.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | See above                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 301 | Individual/employee, Carbonext     | Part 2: Core Carbon Principles | te              | One general aspect, more attention should be given to Natural Climate Solutions (NCS) projects, beyond jurisdictional REDD+ programs and also including forest project-based credits also eligible for CCP credits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | More attention and consideration should be given to Natural Climate Solutions (NCS) projects, beyond jurisdictional REDD+ programs and also including forest project-based credits also eligible for CCP credits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 301 | Individual/employee, Carbonext | Part 2: Core Carbon Principles | te              | One general aspect, we became concerned with the text largely silent on Natural Climate Solutions (NCS) projects, with the exception of jurisdictional REDD+ programs. As described, many of the requirements proposed in the Assessment Framework, especially regarding additionality and permanence, would not be possible to be met by NCS projects. Which would exclude all projects of the type from being applicable as CCP credits and therefore, CCP credits would likely not include credits from natural carbon sinks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 301 | Individual/employee, Carbonext | Part 2: Core Carbon Principles | te              | At the date, forestry and land use change credits correspond to the largest fraction of credits generated in the voluntary carbon market. NCS have the biophysical potential to provide a third of the reductions and removals needed to meet Paris targets. Furthermore, one of the main reasons for this is the growing interest of the market in this type of credit, since in addition to the climate issue, NBS credits provide benefits to the community, biodiversity, soil, and water quality where they operate. In Brazil, for example, the role of preserving the integrity of the Amazon Forest goes far beyond the climate and biodiversity gains: it benefits the entire water cycle in South America. Which, in turn, contributes to water, food and energy security of more than thousands of people [1],[2].                                                                                                                                                                                                                 | 0               |
| 301 | Individual/employee, Carbonext | Part 2: Core Carbon Principles | te              | Assessing the importance of fomenting the conservation of tropical forests on an even broader scale, highlights the importance of their preservation beyond the carbon emission/sequestration issues. A research work developed by Lawrence and Vandecar published in Nature Journal in 2014[3] is one of the many high quality research projects that clearly demonstrate the crucial need to preserve tropical forests regarding the global climate. The paper shows the extratropical effects on precipitation due to deforestation in each of the three major tropical regions, Amazônia, Africa, and South Asia. The tropical forest deforestation has implications on precipitation patterns all over the globe, which has a direct impact over cropping, water supply and energy production, consequently, over the global economy. Preserving the remaining tropical forest is crucial for a global sustainability and, therefore, NCS which are an effective tool to foment forest preservation, should be given a proper attention. | 0               |
| 301 | Individual/employee, Carbonext | Part 2: Core Carbon Principles | te              | Currently, most of the NCS credits traded in VCMs come for project-based REDD rather than JREDD programs which are still being gradually implemented. Preventing project-based REDD projects from attaining CCP certification, effectively excludes the largest source of credits from the market and, many of the NBS credits benefits to climate, society, and the whole ecosystem. Instead of keeping this credit type apart from the CCP eligibility, it would be more interesting to provide appropriate approaches to deal with its risks. Robust buffer pools and reinsurance schemes to cover the risk of reversal provide an alternative to the permanence criteria laid out in the text.                                                                                                                                                                                                                                                                                                                                            | 0               |
| 301 | Individual/employee, Carbonext | Part 2: Core Carbon Principles | te              | It also quite import to remaind that REDD+ project benefetis goes way beyond the climate gains. In the Amazon region, for example, there over 30 million people which are indigenous and traditional community, that can be strongly benefit from the carbon project                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |

| 302 | Anonymous                      | Part 2: Core Carbon Principles | ge              | It would be much better for the ICVCM to create a single, simple, flexible threshold standard that can be applied now, and which many credit types have a chance of meeting, and then ratchet these requirements up over time as the market develops. As currently written, even the highest-quality NBS projects would have a hard time qualifying for the CCP, which will send misleading signals to the market. The enormous resources required for ICVCM to manage this set of programs will also create uncertainty and bottlenecks at a time when we need to be catalyzing investment at massive scale.                                                                                                                                                                                                                                                                                                                                                                                                                                 | See above.      |
| 302 | Anonymous                      | Part 2: Core Carbon Principles | ge              | Our specific comments on issues related to how the IC has chosen to define and evaluate the CCPs are in the relevant sections of the Assessment Framework.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |

| 303 | Mark Glossoti                  |                     | ge              | We understand the purpose of the draft Core Carbon Principles (CCPs) and Assessment Framework (AF) is to provide a credible, rigorous, and readily accessible means of identifying high-quality carbon credits that create real, additional, and verifiable climate impact with high environmental and social integrity.                                                                                                                                                                                                                                                                                | -                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 303 | Mark Glossoti                  |                     | ge              | In principle, we support IC-VCM's ambition to set new threshold standards for high-quality carbon credits and to establish guidance on how to apply the CCPs. CIX also supports the related work of the Voluntary Carbon Market Initiative (VCMI) to guide corporate claims. The work of the IC-VCM and VCMI is of vital importance to ensure high integrity in the generation and exchange of voluntary carbon credits.                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 303 | Mark Glossoti                  |                     | ge              | Notwithstanding this laudable purpose we have concerns that the proposed implementation would lead to overly complicated processes that do not strike the right balance between the need for integrity and practical realities on the ground. There needs to be a balance between raising the integrity of the market while ensuring that it continues to progress.                                                                                                                                                                                                                                     | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 303 | Mark Glossoti                  |                     | ge              | If the purpose of the CCPs is to exclude projects with insufficient integrity, we express concern that the proposed CCPs will exclude many initiatives creating positive impact, narrowing the market to a handful of best-in-class projects. It seems that currently no Nature-based solution (NBS) program meets the CCPs for high integrity. To investors it could be misinterpreted as the lack of quality in the market. Instead of bringing confidence in the market, the IC-VCM's efforts may result in the opposite. A gradual, stepwise implementation of the CCPs may lead to better results. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 304 | Thomas Hämmerle                |                     | ge              | Is there a transparency register to see which carbon-crediting programmes elaborated on this draft?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 305 | Anonymous                      |                     | ge              | Transparency is a principle supporting integrity and confidence in performance claims made by credits. However, it is absent from the core principles.                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Insert "Transparency" as a core principle                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 306 | Anonymous                      |                     | ge              | ICVCM intends to continually monitor and improve the principles. That might result in situations where projects which aligned with earlier iterations of the principles and are continuing to issue credits may not necessarily comply with revised principles, with implications for perceptions of credit quality, market demand and revenue accruing to stakeholders, including indigenous peoples. How might this be addressed?                                                                                                                                                                     | To be determined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 311 | Anonymous                      |                     | te              | We suggest removing financial additionality as the test as to whether a project should be eligible for crediting. Financial models can be manipulated to 'prove' a need for carbon finance, which renders the test an approximation – at best.                                                                                                                                                                                                                                                                                                                                                          | Additionality needs to be viewed holistically – there are many other barriers and reasons why implementing a carbon project may not be the business-as-usual path. New technologies require new training, personnel, knowledge on how to operate. Social norms and behavioural tendencies also favour the 'tried-and-true' rather than taking a risk on a newer, less commercial option. It is our opinion that a common practice or penetration rate test should be the test of additionality and we caution that this rate, and what is considered common practice, will vary widely between project type and geography – therefore a blanket approach will not suffice. |
| 312 | Individual/employee, Finnwatch |                     | ge              | Under validation and verification and/or under quantification there should be an explicit mention that ex-post verification/quantification of mitigation activity is required from the crediting programs. This can now be found in the glossary, but the requirement should be explicitly mentioned in the text itself.                                                                                                                                                                                                                                                                                | Under validation and verification and/or under quantification there should be an explicit mention that ex-post verification/quantification of mitigation activity is required from the crediting programs. This can now be found in the glossary, but the requirement should be explicitly mentioned in the text itself.                                                                                                                                                                                                                                                                                                                                                   |
| 312 | Individual/employee, Finnwatch |                     | ge              | Under sustainable development impacts and safeguards there should be a strict requirement to respect human rights in line with UN Guiding Principles in all mitigation activities.                                                                                                                                                                                                                                                                                                                                                                                                                      | Under sustainable development impacts and safeguards there should be a strict requirement to respect human rights in line with UN Guiding Principles in all mitigation activities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 313 | Individual/employee, Climate Connect      |                     | te              | The CCPs focus is only on the carbon credits outcome of the projects with less stress the climate resilience of the mitigation activity                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | The CCPs need to consider addressing the issue of Climate resilience to ensure that the mitigation activities generating the carbon credits are resilient to future climate change impacts in the region where these are located. This is also a significant risk to the project investors as well as market participants entering into forward contracts or ERPAs with such projects. A few examples of assessing climate resilience of carbon projects are as follows: glacial lake outburst floods and hydro power projects, changing wind speeds and wind power projects, rising sea level and mangrove carbon projects and extreme temperature events and forest fires in forest carbon project areas |
| 314 | Individual/employee, Meo Carbon Solutions |                     | te              | In our opinion focusing only to financial barriers limits the overall concept of additionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Additionality should cover all the other types of barrier that prevent mitigation activities to be part of the BAU status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 315 | Anonymous                                 |                     | ge              | Additionality should cover the the elements that will determine that the project is physically additional and therefore making a net contribution to emission reduction of sequestration - a focus on whether carbon revenues are required to create the underlying project is a detrimental to the physical growth of projects because it takes no account of other funding elements, such as state funding through government policy or the incentives required to stimulate a behavioural change in order to create the project.                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 315 | Anonymous                                 |                     | ge              | Fundamentally the linking of the carbon financing element with a narrow interpretation, to the physical additionality of the environmental project is likely to be detrimental to the ability to produce projects.                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 316 | Trevor Paul                               |                     | te              | As an independent governance body whose stated intention is to develop a common standard for ensuring the creation of quality voluntary carbon credits, the focus IC-VCM mandate should be at the crediting program level – using the framework to assess carbon crediting programs, their systems and credit methodologies against commonly agreed to Core Carbon Principles (CPP). Viresco Solutions believes there needs to be a broad dialogue and alignment among stakeholders to the CPP's and around assessment framework to ensure integrity of voluntary markets, but also results in requirements that are practical to implement. | The IC-VCM's focus should be on facilitating alignment around the CPPs and implementation of an assessment framework that holds crediting programs to their responsibility to implement robust and transparent credit creation and assurance systems and processes.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 317 | Anonymous                                 |                     | ge              | Requiring all 10 requirements to be fully filled will cut most of the programs out. When the requirements are so strict the voluntary carbon markets without ccp approval will stay more wild for longer.                                                                                                                                                                                                                                                                                                                                                                                                                                    | Better option to fully fill of all requirements would be some easy to reach starting, and possibility to develop stage for starting programs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

In particular, CPP principles should encourage projects with "stackable" benefits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 319 | Individual/employee, Carbonext |                     | ge              | Overall, we support the Core Carbon Principles. However, we would like to say that the criteria and requirements established in the Assessment Framework can significantly harm the market. The monitoring and verification systems needed to meet the principles are costly and not easily implemented, which in turn would slow down the voluntary market. This downturn goes against the urgent need to accelerate climate actions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | We strongly believe ICVCM should consider reassessing the proposed principles and take into account other serious programs, frameworks and initiatives that are doing a significant and feasible work, such as CORSIA and ICROA.                                                                                                                                                                                                                                                                                             |
| 320 | Thomas Hämmerle                |                     | ge              | Additionality for carbon dioxide removal, should be defined by a carbon baseline, not by economics. When additionality was originally defined, humanity had several options to mitigate climate change. Nevertheless, time passed, and realistic opportunities are getting rare. It is clear carbon dioxide removal must be established to reach Paris Agreement. Therefore, we call to clearly separate between carbon emission reduction and carbon dioxide removal (our expertise). For carbon dioxide removal, concepts and solutions should be evaluated by their climate and social impact as well as maturity and scalability, instead of using economic reasons per definition. Furthermore, several examples show that investing into climate change solution will lead to reduced costs of in-action as well as economic improvement. For example, the voluntary carbon market emerged pyrogenic carbon capturing and storage (PyCCS) in a short amount of time to the leading technology for carbon sequestration. 2022 already 100.000 tons of CO2 will be sequestered through PyCCS. A growth rate of more than 80% could be observed, leading to several jobs and value creation. Nevertheless, the economic factor could be used as a characteristic. | Original: "The greenhouse gas (GHG) emission reductions or removals from the mitigation activity                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 321 | Anonymous                      |                     | ge              | XXX welcomes the opportunity to respond the public consultation process for the Integrity Council for the Voluntary Carbon Market's ("IC-VCM") Core Carbon Principles ("CCPs"), Assessment Framework ("AF") and Assessment Procedure ("AP") and appreciates the IC-VCM's efforts to bring consistency to, and enhanced confidence in, this market.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | XXX' desired outcome is for the work of the Integrity Council to create confidence in the VCM, allowing it to grow, scale, and access mainstream capital markets. Based on the initial review of the CCPs and Assessment Framework drafts, however, XXX has identified a number of concerns regarding the proposed CCPs that may impede this desired outcome. What follows are some general observations of areas where additional consideration is warranted, followed by commentary on specific sections of the documents. |
| 321 | Anonymous                      |                     | ge              | As a global investment bank that provides carbon markets advisory to public and private clients, XXX views integrity as a precondition for a transparent, standardized, liquid and scalable VCM that efficiently channels capital into greenhouse gas ("GHG") reduction and removal activities. We view the IC-VCM's work as having the potential to accelerate investment and, in so doing, contribute to achieving the Paris Agreement goals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 1. IC-VCM Governance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 321 | Anonymous            |                     | ge              | Voluntary carbon offsets are currently being issued by a number of reputable parties (Verra, American Carbon Registry, Gold Standard, Climate Action Reserve etc.) in a manner that is credible and largely characterized by integrity. However, the diversity of standards, protocols, technologies, and approach to vintages limits consistency and creates confusion among buyers of offsets. Accordingly, there is a strong desire for the development of a benchmark that will help to eliminate some of the uncertainty that currently exists and facilitate ongoing improvement. XXX believes that the IC-VCM, acting as a governing body on the CCP, AF, and AP, has the potential and opportunity to: | The IC-VCM is positioning itself as a "supra-standard" assessing the compliance of both existing voluntary carbon market standards/programs and specific methodologies with the CCPs and the AF. Nonetheless, the governance and decision-making approach of the IC-VCM does not appear to be certain and predictable.                                                                                                                                                                                                                                 |
| 321 | Anonymous            |                     | ge              | 1. Improve consistency and comparability within and across disparate standards, and develop robust, best-in-class practices. Effective and harmonized governance of offset and inset standards will be essential for the success of the VCM and the converging compliance carbon market as a key lever to help mitigate climate change in a manner that is fair and equitable for suppliers, and affordable for end-users as they transition to net zero; and                                                                                                                                                                                                                                                  | 2. Commercial and Operational Viability                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 321 | Anonymous            |                     | ge              | 2. Reduce uncertainty for corporate offset and inset buyers through transparent and global threshold quality criteria that will reduce transactional friction and the transaction costs for all market participants, and thereby create scale and greater liquidity in the global carbon markets.                                                                                                                                                                                                                                                                                                                                                                                                              | As it currently stands, the IC-VCM Framework risks sacrificing the scaling and the pragmatic growth of the VCM in order to pursue the highest-quality criteria set out in the CPP and AF/AP. In order to be "CCP-compliant", a carbon offset would need to meet very stringent and costly criteria that we do not view as commercially or operationally feasible in the short term. In particular:                                                                                                                                                     |
| 321 | Anonymous            |                     | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | · The criteria must reflect current practice and cannot be set as aspirational targets with the effect of precluding most emission reduction and removal projects that give rise to credible, integrity-based offsets and insets.                                                                                                                                                                                                                                                                                                                      |
| 321 | Anonymous            |                     | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | · The monitoring and governance systems required to implement the CCP and AF criteria would demand considerable human resources and capital investments that could inhibit otherwise high-quality credits from entering the market.                                                                                                                                                                                                                                                                                                                    |
| 321 | Anonymous            |                     | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | · Based on our knowledge of the market, we believe that only a small number of carbon credit programs would qualify under the CCP criteria as drafted, thus reducing the flow of funds to otherwise good offset projects. For example, the proposed approach to the CCPs and the AF may preclude a number of carbon sink projects, for example, that are necessary to facilitate good offset projects and preserve and enhance carbon sinks in accordance with the goals of the Paris Agreement.                                                       |
| 321 | Anonymous            |                     | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | XXX urges the IC-VCM to create an initial threshold standard based on current best practice in the market and facilitate continuous improvement by building on existing assessments by ICROA and CORSIA, that can be promptly applied and achieved by well-established programs. This could eventually be followed by a process that will expand the requirements over time backed by science and the experience gained with the practical application of the threshold standard.                                                                      |
| 321 | Anonymous            |                     | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 3. Learning From Precedent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 321 | Anonymous            |                     | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | XXX observes that there is significant precedent within the broader carbon market for the creation of high-integrity offsets, specifically those from compliance carbon markets. Alberta, for example, has had a carbon offset program in place since 2007, while offsets within California's cap-and-trade market have been generated since 2013. These offset programs and associated offsets, while falling within compliance markets, bear the hallmarks of high-integrity offsets, including additionality, verification, registry tracking, etc. |
| 321 | Anonymous            |                     | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | We believe that the program regulators, overseeing existing compliance carbon offset programs, could bring enormous value, expertise, and insight to the creation of the CCPs and what works and what doesn't. In our review of the materials from the IC-VCM, and in conversation with some regulators, we did not detect that there had been engagement with them to date.                                                                                                                                                                           |
| 321 | Anonymous            |                     | ge              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Incorporating the experiences of the compliance offset market would be more efficient, as it would lead to alignment between compliance and voluntary markets. Given the desire for high-integrity offsets that are increasingly standardized, this could be an important foundational step to the voluntary markets long-term growth and interoperability.                                                                                                                                                                                            |

| 322 | Seoyi Kim            |                     | ge              | As carbon markets under the Paris Agreement operate under the countries' NDC context, the requirements to demonstrate the unit quality need innovative approaches that address uncertainties of the methodologies used under the CDM, facilitate faster and more inclusive market access, and ensure the credibility of markets. As markets under the Paris Agreement are expected to support increasing the ambition of countries' climate action, approaches should take NDCs, long-term strategies (LTSs), and their baselines into consideration. Accordingly, the approaches that rely on stringency of NDCs and how the targets are set under NDCs should be considered. Recognizing that the methodologies to validate the stringency of NDCs and LTSs are still evolving, the MDB WG proposes a phased approach to demonstrate the environmental integrity - where feasible to establish the stringency of the climate plans, it is sufficient to perform the corresponding adjustments to demonstrate the integrity; where not feasible, the same can be achieved through both stringent or conservative baselines and corresponding adjustments. Importantly, the MDBs plan to increase their support to LTSs that lead to net-zero or net-negative targets by certain deadlines and ensures that such support also takes care of environmental integrity considerations. In addition, countries should be encouraged to develop positive lists, benchmarks and standardized baselines. Approaches that rely on financial aspects of the projects and barriers they face are highly subjective and hence should be prioritized less. | 0               |

| 322 | Seoyi Kim            |                     | ge              | In relation to the comment provided in #1, having a separate requirement that the mitigation activity uses a technology or practice that is transformational and consistent with a net-zero emissions goal by mid-century is not supportive of the way countries increase their ambitions through carbon markets under the Paris Agreement. Countries have different mitigation options that have different cost, and implementing every mitigation option counts in achieving the country's NDC and beyond (LTS). Moreover, majority of countries have not yet set up their targets/goals consistent with a net zero emissions goal under an LTS. In that sense, approaches that rely on stringency of NDCs and how the targets are set under NDCs are more desirable and effective in catalyzing climate actions and investments and ensuring integrity of the overall carbon markets. Detailed requirements of the eligible mitigation activity laid out in the draft CCP only put excessive policing, which may dampen the market unnecessarily. It is important that new systems and approaches support increasing the transparency to create value first and facilitate learning by doing. Information such as the type of mitigation, technology, practice, and sectors of the underlying mitigation activity, however, is what buyers would be interested in and have different preferences for. Therefore, it is important to transparently disclose such information, and, for example, the Climate Warehouse data taxonomy is designed to support that.                                                                             | 0               |

| 322 | Seoyi Kim            |                     | ge              | The MDB WG considers that the CCP requirements on permanence are too detailed, which limits innovation in this space, and it is largely based on common misconceptions regarding non-permanence risk.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 322 | Seoyi Kim            |                     | ge              | Regarding the requirements on the degree of reversal risk, it is assumed that any mitigation activity related to the management of carbon stocks has a material risk of reversals, and that projects that would lead to a lower demand of fossil fuel have a zero risk. However, as experience shows with recent trends, the fossil fuels that were saved and left in the ground, could be extracted again in the future if economic conditions are adequate for it (e.g., electricity prices), reverting the mitigation process. This is not different from a jurisdictional REDD+ program where the carbon saved could be released in the future if economic conditions make this to be favorable (e.g., commodity prices). Therefore, we would suggest revisiting the concept of non-permanence and looking at this with a different perspective.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |

| 322 | Seoyi Kim            |                     | ge              | The assessment framework provides two recommended approaches for addressing non-permanence risk, which are prescriptive, not backed by science, and limit the possibility of using other approaches and options. On the requirements on monitoring and compensation for reversals approaches, requirements are applicable to any kind of intervention regardless of the inherent risk of the intervention, which is incorrect. A large-scale jurisdictional program or a national policy to increase use of wood harvested products might not have the risks that exist in a small-scale Afforestation/Reforestation project, but all these are conflated. Moreover, the commitment to monitor and compensate reversals for more than 50-100 years would not justify the actual risk of reversals and would be extremely costly, making unfeasible for projects to generate emission reduction credits. On the use of temporary crediting, this approach was proposed under the CDM, but it was demonstrated that there are more pragmatic approaches, and that this represents a very significant barrier for scaling up of markets as these temporary units would not be fungible with other units. | 0               |
| 322 | Seoyi Kim            |                     | ge              | GHG Programs and Standards have followed science-backed robust processes to define the approaches to manage reversals at GHG Program level, and there should be more trust on these processes, instead of prescribing approaches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |

| 322 | Seoyi Kim            |                     | ge              | The MDB WG considers that ensuring a high level of security for the marketplace will only increase trust in the market. Therefore, any new technology (e.g., digital) increasing the safety, reliance, and transparency of the MRV process should be welcome. The draft CCPs do not mention the use of new technologies to support monitoring, reporting, and verification (MRV) processes for projects under the standard, nor the need for programs to update protocols and methodologies to accommodate new solutions. While not a requirement for a program to be eligible, the draft CCPs could reference the need for eligible programs to move in this direction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 322 | Seoyi Kim            |                     | ge              | In terms of quantification, there is a problematic requirement from the assessment framework that overlays the use of conservative methods over accurate and most precise approaches, which undermines the efforts of programs and projects to make progress towards improving MRV methods. Therefore, care should be taken when relating conservativeness versus accuracy to ensure that programs and projects use the best available methods and approaches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 322 | Seoyi Kim            |                     | ge              | Also, in terms of rules for accounting carbon credits inside REDD+ jurisdictional programs, it is important to clarify that the rules for nesting are often defined by sovereign governments, and projects and programs need to comply with them. Therefore, rather than requiring having specific procedures in place for aligning baselines at the standard level, the standards should look at how projects/programs are aware of their responsibilities to comply with the local legislation, and such compliance should be validated and verified by third-party entities, which is currently the normal approach under most internationally recognized standards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 322 | Seoyi Kim            |                     | ge              | 5.Infrastructure for transparency and addressing double counting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 322 | Seoyi Kim            |                     | ge              | While registries are critical to record and track mitigation activities and carbon credits issued, communication between different program registries is essential to prevent double counting as it enables verification of the history of transactions and modifications made to the projects and credits. The draft CCPs, however, focus only on the former – carbon crediting programs having a registry, but not on the latter – the need for such registries to communicate with each other, which can be supported through use of common data formats and taxonomy in the different programs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 322 | Seoyi Kim            |                     | ge              | The Climate Warehouse, a global public meta-data layer that is designed to support transparency of markets, has developed such data model through consultations with multiple stakeholders over the past three years. The initiative also provides minimum functionalities and technical specification of a robust registry. The draft CCPs would benefit from incorporating outcomes of the initiative into their registry requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 322 | Seoyi Kim            |                     | ge              | Also, the assessment framework includes several requirements that seem to be more applicable to end-users (buyers of credits) than projects/programs. For instance, assessing the provisions towards the transition to net-zero emissions, the use of proceeds from issued carbon credits and tracking of funds, and overseeing the chain of custody after credits are issued, are all issues that go beyond the scope of carbon Standards. Therefore, if approved, this requirement will be very difficult (if not impossible) and costly to be achieved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |

| 322 | Seoyi Kim               |                                                                                | ge              | In relation to the comment provided in #5, attributes are useful to describe and differentiate emission reductions and are included in the common data taxonomy developed under the Climate Warehouse. Based on the experience with the Climate Warehouse, however, it is important that the attributes that are considered are properly recognized, sufficiently incentivized and compensated. Efforts should be made to identify and enable simple solutions to support monitoring and tracking of identified attributes to consider the attributes that are easy to track, do not put additional burden on project developers, and are directly attributable to the project operation. | 0                                                                                                                                                                                                                                                                                   |

| 322 | Seoyi Kim               |                                                                                | ge              | The balance needs to be maintained between the requirements for standards to ensure net positive SD impacts and for ensuring robust environmental and social safeguards. While ensuring net positive SD impact is desirable, having it as an additional attribute like the way the draft suggests (in #12.2 quantified SDG impacts) may be sufficient.                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                                   |
| 323 | Anonymous               | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | Emission reductions, objectively, technically don't offset or balance out emissions. Why are emission reductions included as offsets? Only atmospheric carbon removals should be certified and used by companies to offset emissions. Anything else is just an accounting trick; a negligent accounting trick, and objectively incompatible with any 1.5 degree Celsius aspirations.                                                                                                                                                                                                                                                                                                      | Only certificates originating from *present-year* atmospheric carbon removals can be used to offset present-year emissions. Present-year emission reductions cannot be used to generate offset certificates. Future-year, projected atmospheric carbon removal cannot be certified. |
| 324 | Rosa Maria Roman-Cuesta | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | For the land use sector, carbon credit revenues at current market prices rarely compensate for the fix and transaction costs of the carbon crediting operations. What is the benefit of including financial additionality as a requisite?. As far as there is mitigation and legal additionality, I would not restrict land use investment for carbon offsets.                                                                                                                                                                                                                                                                                                                            | i.e. they would not have happened in the absence of the carbon project and respect mitigation and legal additionality.                                                                                                                                                              |
| 325 | Anonymous               | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | Assuming marginal abatement cost curves (MACC) have been developed at the country and sector level in support of a countries NDC they can be leveraged to guide additionality. It can also help demonstrate how certain projects and associated carbon credits are clearly additional in particular in the case where they support the development of technologies which have yet to reach commercialization phase at a local or global level. In addition robust MACC help guide both the price as well as abatement potential and can be used in the financial attractiveness and market penetration assessment.                                                                        | N/A. Please see the comment.                                                                                                                                                                                                                                                        |
| 326 | Paul Renaud             | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | te              | Pure Additionality is based on the concept that changes in Land Use do not occur. Yet the IPCC warns us that changes in land use represent the greatest risk to climate mitigation measures. The definition needs to be more flexible to admit the need for protecting the sequestration that is already occurring in natural areas - especially in circumstances where changes in land use will result in loss of sequestration over time. This can be assessed on a variety of basis: risk, demonstration of prior losses, economic disbalance that favours loss of sequestration capacity (e.g. due to likely development), etc.                                                       | Additionality encompasses necessary activities to protect of existing sequestration in circumstances where it the risk of loss of existing sequestration can reasonably be established. The effectiveness in preventing losses shall be monitored accordingly.                      |
| 326 | Paul Renaud             | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | te              | If additionality does not protect against erosion in sequestration, then we are building castles on quicksand.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0                                                                                                                                                                                                                                                                                   |
| 327 | Aya Yamazaki            | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | This principle related to additionality should not be too much strictly applied. The financial attractiveness cannot be judged in a black-and-white way, rather being matter of degree. In its application, the principle should be implemented flexibly so as not to limit the supply too much.                                                                                                                                                                                                                                                                                                                                                                                          | Wording to the effect of the flexible implementation should be added.                                                                                                                                                                                                               |
| 328 | Johan Börje             | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | The approach suggested for additionality seems adequate for traditional off-sets. The main challenge for traditional off-sets is that they are based on a counter-factual assessment and/or have an inherent in-value-chain-worth for the project owner. For both those reasons, it follows that it is genuinely difficult to assess the true additionality of funds coming from sales of carbon credits.                                                                                                                                                                                                                                                                                 | -                                                                                                                                                                                                                                                                                   |

| 328 | Johan Börje          | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | For negative emissions with geological storage the situation is completely different. They don't have any inherent in-value-chain-worth for the project owner. They are only produced for the purchaser of the negative emission rights, without the potential to come about for any other reason. The counter-factual assessment is very clear – they would not happen without the purchase of the negative emission right associated with the underlying physical removal.                                                                      | 0               |
| 328 | Johan Börje          | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | There is, however, one critical limitation to this argument that must be assessed from an additionality perspective. If the project is eligible for state aid and such aid would be comprehensive enough to allow the project to meet its profitability targets without the carbon credit revenues, then – if the project receives such aid – the project would not be additional.                                                                                                                                                                | 0               |
| 328 | Johan Börje          | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | On profitability, the rule book should welcome high profitability, since the business risk of investing in volume production of negative emissions is high – it has never been done before. Thus, for this type of mitigation outcome, IRR must not be a criteria. The criteria is simple – is the project profitable without the carbon credit revenues? Of course, to assess the profitability, there is a need to set a discount rate/WACC for the NPV calculation, with a project being considered profitable if the NPV is larger than zero. | 0               |
| 328 | Johan Börje          | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | For the certification, a project owner should, thus, be expected to be able to defend the chosen discount rate, which for negative emission projects could be much higher than a company's WACC for traditional projects. The project owner should only be expected to present a rather simple summary calculation, not the full details of the project's discounted cash flow analysis.                                                                                                                                                          | 0               |
| 328 | Johan Börje          | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | If there would be disagreement, the company's auditors may need to confirm that the simplified calculation is a representative summary of the full analysis. Such confirmation by the auditors may also include, if applicable, that costs and revenues have been divided in a reasonable manner between production of negative emissions and other possible products produced in connection therewith.                                                                                                                                           | 0               |
| 328 | Johan Börje          | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | Of course, neither must the project be part of a compliance regime, where the project owner is mandated by law to produce the negative emissions, or the acquirer required by law to purchase such instruments. In this context it should be noted, however, that beyond 2030 it is not unlikely that a single plant may be producing negative emissions both for voluntary and mandated purchases, and that the (future) rule book must be able to manage such a scenario.                                                                       | 0               |
| 328 | Johan Börje          | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | To sum up, for negative emissions with geological storage, the following should be required for additionality:                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |

| 329 | Individual/employee, Perspectives Climate Group | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ed              | The additionality definition should include a high level description of all approaches to demonstrate additionality applied in the assessment framework.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | The additionality definition should include a high level description of all approaches to demonstrate additionality applied in the assessment framework.                                                                             |
| 330 | Anonymous                                       | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | Agree with the fundamental concept around assessing additionality, but I see the benchmark IRR varying widely enough that it could continue to call into question the additionality of projects in the future. Eg., an organization may require a 10% IRR for projects to move forward, but an external perspective may say that a breakeven project should be good enough.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Under the 'benchmark' section in 8.1                                                                                                                                                                                                 |
| 330 | Anonymous                                       | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | If the idea is to get as many projects going as possible, the benchmark IRR shouldn't be too restrictive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | "The benchmark IRR often varies between countries, sectors, organizations, and the type of investment."                                                                                                                              |
| 331 | Individual/employee, KOKO Networks Limited      | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | te              | Agree fundamentally but the definition should include the purposiveness of recurring carbon revenue in determining additionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | The greenhouse gas (GHG) emission reductions or removals from the mitigation activity shall be additional, i.e., they could not have occurred in the absence of the continual/recurring incentive created by carbon credit revenues. |
| 332 | Ivan VALENCIA                                   | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | Safeguards and additionality – The CCPs are very detailed in these topics and probably and the distinctions between the Initial and Full thresholds are reduced. These are areas where complexity must be reduced particularly for the Initial threshold, otherwise they become a big deterrent for programs to seek CCP certification. GGGI holds the highest standards of environmental integrity but at the same time accompanies developing country governments to initiate projects and reach trades but we are always wary of new badges coming into the market that will then be used as a minimum standards by buyers, being likely very onerous for the sellers to meet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Refer to comment on this section                                                                                                                                                                                                     |
| 333 | Darcy Jones                                     | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | te              | Carbon credit revenue is not the only evidence of additionality, in particular for the case of jurisdictional programs. Additionality is dependent on whether reductions would have happened even without a particular project or program, not necessarily tied to the revenue but more to performance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | This should be reworded to add "... or, for jurisdictional programs, that the emission reductions or removals would not have occurred in the absence of a carbon crediting program."                                                 |
| 334 | Anonymous                                       | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | While we agree with the Integrity Council's definition of additionality, we do have concerns about the practicality and implementation of some of the Assessment Framework for additionality, particularly for nature-based removals such as afforestation and natural reforestation projects. Once the initial assessment of additionality of a nature-based removal project has been completed and the project starts, we do not agree that this project should undergo an additionality assessment each year. For nature-based projects, a forest could be planted (meeting the initial additionality assessment); however once it is planted, it could be argued that the forest no longer meets the additionality requirement as the trees will continue to grow (even though ongoing carbon finance is expected by the landowner to cover costs). Furthermore, the proposed additionality assessment is rigorous and will require extensive documentation and quantification. It would be impractical for mitigation activities to undertake this assessment each year and would also increase the cost of project delivery and erode the funds available to maintain the project. | Please see above.                                                                                                                                                                                                                    |
| 335 | Individual/employee, Rights and Resources Group | Section 8 of Assessment Framework and section G of Summary for Decision-Makers | ge              | Additionality: while common to virtually all VCM frameworks, this principle presents considerable barriers to IPs and LCs who have successfully and sustainably maintained forests and other carbon-rich ecosystems -- in spite of the myriad pressures and challenges they face. It is unclear how all of the proposed assessment criteria might prove beneficial to the unique circumstances that communities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | If VCMs are intentionally designed to support IP and LC roles and contributions, then the additionality assessment criteria should specify how and under what circumstances communities will benefit from these actions.             |
| 336 | Johan Börje                                     | Section 6 of Assessment Framework and section E of Summary for Decision-Makers | ge              | This principle is important. The more information the better. Only information that constitutes critical business information, like the detailed NPV analysis as mentioned under additionality, should not be expected to be available to the public.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | -                                                                                                                                                                                                                                    |

| 339 | Anonymous                                       | Section 6 of Assessment Framework and section E of Summary for Decision-Makers | ge              | Our consortium believes credit owners should have access to data related to that very unit and rights to share with potential buyers, its investors, etc., even decades later when key companies/organizations might close their operations and don't pay web hosting anymore to supply data. In such a case, do their incentives outpace their costs for sure?                                                                                                                                                                                                                                                                                                                                                                                     | 'The information shall be publicly available in electronic format for a minimum of 50 years after the issuance. It is recommended to use self-sovereign data providers (such as Ethereum Swarm) for this, to not depend on web hosting, and to share more sensitive contextual information with credit stakeholders. Scrutiny of mitigation activities shall be accessible to non-specialized audiences.' |
| 340 | Richard Tipper                                  | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | te              | The current definition is unclear as to how or whether double-counting against emissions and removals within national GHG inventories should be avoided or at least explained. The terms "goals and targets" are also vague since a country may have a stated goal for zero deforestation or x% renewable energy but it may not have policies in place to achieve those aims. Indeed much of the activity in the voluntary market is aimed at shoring-up or making good the deficiencies of policies or government capabilities. It would be clearer to separate out the issues of - A. Whether carbon credit enabled voluntary mitigation actions undertaken in support of national goals where these goals would not be met without those actions | ...Shall be counted where carbon credit-enabled voluntary mitigation actions undertaken in support of national goals that would not be achieved without those voluntary actions;                                                                                                                                                                                                                          |
| 340 | Richard Tipper                                  | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | ...But shall not be double-counted by the issuance of more than one credit per unit of avoided or removed GHG (for example, the double counting of avoided emissions from renewable energy both as credits and as RECs and/or as reduced carbon intensity of electricity).                                                                                                                                |
| 341 | Anonymous                                       | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | With regards to Permanence, it's not clear what is meant by the reversals of Credits which need to be compensated if they are reversed. For example, Carbon removal could be reversed by Natural disasters such as fire, storms, disease beyond the control of the Land managers. These are inherent natural cycles. We should be rewarding the right behaviours for which people have control, and not penalising for disasters outside of their control.                                                                                                                                                                                                                                                                                          | Categories Carbon Credit reversal into various categories - Natural Disaster, Man Made, etc. And apply different reversal penalties.                                                                                                                                                                                                                                                                      |
| 342 | Rosa Maria Roman-Cuesta                         | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | While no-double counting is an absolute must, jurisdictional nesting needs remains a chaos and certain level of tolerance will be needed to achieve coherent scaling up and robust traceability along jurisdictions. Nesting, by default, reduces additionality at local scale. A separate subsection on how to tackle jurisdictional nesting may be of use under this principle.                                                                                                                                                                                                                                                                                                                                                                   | A separate subsection on how to tackle jurisdictional nesting may be of use under this principle.                                                                                                                                                                                                                                                                                                         |

| 343 | Paul Renaud          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | te              | Need to be cautious in not disallowing cumulative improvements to be made. Eg. one set of initiatives on increased sequestration might be followed by a separate set of initiatives on reduced emissions in the same area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | In criterion 4.2, a credit for emission reduction or removal is permissible where credits for increased sequestration have been issued under another mitigation activity that does not encompass the activities related to emission reduction/removal (and vice versa). Similarly, if enhanced reductions are obtained via a new set of mitigation activities, they are not a double count over prior emission reduction activities.                                                      |
| 343 | Paul Renaud          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | te              | For example, in the forest products sector reduced harvesting frequency leads to enhanced sequestration. A separate initiative to reduce the emissions occurring during the harvesting that does occur should be counted as a legitimate addition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 344 | Aya Yamazaki         | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | As for the double-counting issues, my view is to create two distinct sets of VCs: one with the corresponding adjustment with the host countries and another without it. The distinction should be clear and strict. Then, the two sets will be traded differently in the markets and given different prices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Appropriate changes reflecting my comments above are requested.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 344 | Aya Yamazaki         | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | Related to the above. Those VCs with corresponding adjustment should be allowed to be deducted directly from Scope 1 and/or 2 of emissions of the acquirer, including disclosure purposes. Since NDCs are by definition in conformity with the Paris Agreement goals, those credits adjusted as against NDCs should be used for such purposes as well.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 345 | Anonymous            | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | te              | Regarding climate benefits (emission reductions and removals, ERRs) originating from projects in sectors covered by the host country's NDC but where the NDC is not yet able to issue a Corresponding Adjustment, it should be considered to be allowable for international financiers to simply claim "funding ERR of 1 tCO <sub>2</sub> e to support the NDC" without the need of transfer of ownership of ERR. Such a claim would not allow to "offset" (which on voluntary basis is anyway a performance-based CSR with verified impact units) but simply to claim Climate Action.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Emission reductions and removals from projects originating in sectors covered by host country NDC where the issuance of a Corresponding Adjustment is not yet achieved can be claimed by an international financier as "funding ERR of 1 tCO <sub>2</sub> e to support the NDC" when this happens in a private sector, civil society or host country government led project funded by the financier and there is an agreement on such a claim and the funding for it in place.            |
| 346 | Anonymous            | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | te              | Allowing international financiers to fund ERRs in sectors covered by NDC (e.g. forestry & agriculture in developing countries) with their suppliers can help them to still de-carbonize their scope 3 GHG emissions but also to support host country NDC. Thus, turning the problem of CA-block to private carbon finance into a win-win-win where host country wins, local business is a positive leader and international financier can claim Climate Action and de-carbonized scope 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Allowing international financiers to fund ERRs in sectors covered by NDC (e.g. forestry & agriculture in developing countries) with their suppliers can help them to still de-carbonize their scope 3 GHG emissions but also to support host country NDC. Thus, turning the problem of CA-block to private carbon finance into a win-win-win where host country wins, local business is a positive leader and international financier can claim Climate Action and de-carbonized scope 3. |
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | This is a critical principle. The confusion of what it implies and how the accounting of companies and nations relate to one another needs to be clarified and settled. The current situation is threatening the necessary investments that the private sector can and must contribute to climate mitigation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | -                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | The reason for the current confusion is that a mixing of the corporate accounting system with the national/governmental accounting system has been introduced in the debate about the nature of carbon credits. When the two accounting systems are kept separate, then the question of double counting, including double issuance, double claiming and double use, becomes relatively straightforward and the principles outlined in the document are supported. The problem occurs when the concept of double claiming is applied across the two accounting systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | The main argument for applying the notion of double claiming across the two accounting systems, as suggested by proponents of this view, is the potential risk that nations would lower their climate ambitions if they could rely on the corporate sector to achieve their NDCs. There are multiple problems with this argument. First, if ever true, it would only apply to a small minority of nations (which, while part of the Paris Agreement, neither are committed to limiting global warming nor have understood that resisting decarbonization will undermine their economies already by mid-century). To the extent that this would entail larger countries, such countries would irrespective of the accounting rules find ways not to honour their commitments. Thirdly, if this is considered a real problem, nations must address it with a real solution. The real solution is that all countries must set up emission reduction trajectories, per sector, as part of their NDCs and be held accountable towards these trajectories. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|-----|----------------------|--------------------------------------------------------------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | With such trajectories, the VCM could establish rules not to engage in projects in host nations which consistently fail to meet their reduction trajectories. Also, with such trajectories, we could turn the current VCM-hostile discussion into a positive discussion on how corporations could help nations to reach their NDCs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                        |
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | As for negative emissions with geological storage, the notion that the engagement of the VCM could threaten climate ambition is simply a contradiction in terms. The removal projects with geological storage are among the most ambitious projects that can be conceived.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                        |
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | Interpreting/applying Article 6 of the Paris Agreement such that the accounting systems of the corporate sector and nations would be mixed would, contrary to the argument in favor of such interpretation, more likely result in a lowering of ambitions since it would prevent public-private co-funding of critical projects, in general reduce the capital contributed by the private sector to climate mitigation and, consequently, slow down the transfer of knowledge to developing countries.                                                                                                                                                                                                                                                                                                               | 0                                                                        |
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | There are strong arguments to continue to keep the two systems separate, particularly as regards permanent removals (BECCS and DACCS):                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                        |

All emission reductions, whether voluntary or compliance based, are counted by both the corporate level and the national level;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                        |
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | 3. avoid a discrimination between intra-NDC VCM and cross-NDC VCM markets. The application of double claiming within a country would not work or become accepted by governments (which follows from the two first points) and would prevent creative government supported programs for nature-based removals, for instance the EU initiative for Carbon farming;                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0                                                                        |
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | 4. simplification of cross-border trade, both between countries and between corporation (corresponding adjustments would not come into play between countries and corporation), helping to drive and match demand and supply for negative emissions with geological storage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0                                                                        |
| 347 | Johan Börje          | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | Thus, it is strongly advocated that the application of double claiming is strictly limited to claims within each one of the two accounting systems. This means that the IC-VCM code should not accept that the integrity and quality of a project could be called into question in terms of "double claiming" if this takes place across the two accounting systems, but rather the opposite: co-claiming across the two accounting systems is logical and serves to speed up the establishment of DACCS and BECCS industries. This recommendation implies that the authorization of a project under Article 6, or the absence of such authorization, should not be part of the IC-VCM. If this would not be feasible in general, a special exception should be made for negative emissions with geological storage. | 0                                                                        |

| 349 | Emma van de Ven      | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | In all cases of agriculture-related climate mitigation activities, it is crucial to also incorporate supply chain carbon accounting (or scope 3 reduction & removals) when addressing double claiming. This is often not done due to different accounting standards, which undermines both the credibility of the VCM and of supply chain mitigations.                                                                                                                                                                                                                                                                                                                                                                                                                       | Include supply chain carbon accounting in the list of double claiming risks and ensure project developers in both the VCM and in supply chains can compare notes (i.e. follow a lowest common denominator approach like GPS polygons to check for sourcing overlap). |
| 350 | Phil Cryle           | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | te              | Clarity could be provided on how “fully compensated” is defined/measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Clarity could be provided on how “fully compensated” is defined/measured.                                                                                                                                                                                            |
| 351 | Anonymous            | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | ge              | We recommend tracking the products'/units' life-cycle stages along the supply chain in processes where carbon removal/reduction appears. Stakeholders (incl. insurance companies) can verify these. Allowing the backend algorithms to access these progress, it is much less likely to issue or use or claim the same capacity multiple times. To avoid mistrust due to the possibility of a sensitive corporate data breach, we recommend using highly secure blockchain-based providers, such as Ethereum Swarm. Additionally, AI should create charts of potentially overlapping credits and mark them for human review (which task should be sent to a random provider and/or logged on a blockchain to lower the risk of human corruption.)                            | We encourage supply chain traceability software integrations.                                                                                                                                                                                                        |
| 352 | Anonymous            | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | te              | Double counting and double claiming are not the same. Attempting to prevent double claiming will likely create a chilling effect in the market to no particularly important end.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | See above.                                                                                                                                                                                                                                                           |
| 352 | Anonymous            | Section 4 of Assessment Framework and section C of Summary for Decision-Makers | te              | In forestry, cumulative projects that both increase sequestration and reduce emissions are possible (and happen all the time, particularly for projects that take an integrated landscape approach). These are two different types of mitigation activities, each with quantifiable benefits. The ICVCM should be careful not to disallow these.                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                                                                                                                                                                    |
| 353 | Anonymous            | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | te              | Risk to permanence will often be there in many project types and those risks need identification, quantification and mitigation. Simple black & white decisions whether something is permanent or not are not helpful, especially in the NCS segment. Verra and many, many stakeholders did a lot of work to produce a very thorough and applicable Non-Permanence Risk Report for NCS projects. Their approach to a permanence buffer is a functional system for compensating for reversals that has proven track record (which almost all others ideas proposed do not have) to safeguard environmental integrity of climate benefits overall even when individual projects suffered reversals - which might happen, but does not render entire project types low quality. | Risks to permanence should be identified, quantified and mitigated. Buffer accounts to serve as environmental insurance policy to maintain overall integrity even in case of individual reversals shall be set up and managed transparently.                         |
| 354 | Aya Yamazaki         | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | te              | The idea to make reversals be fully compensated would destabilize the related credits and, therefore, make the related programs/projects impossible. This issue should be dealt with probability approach, with pricing differential proportionate to probability of the reversal risks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | The proposed probability approach should be incorporated.                                                                                                                                                                                                            |
| 355 | Johan Börje          | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | It is agreed that there should be clear and robust rules to compensate for reversals. However, the way the principle is formulated seems to extend beyond the details of the Assessment Framework. Nevertheless, the suggested risk-based approach is sound, as is the distinction between Avoidable and Unavoidable reversals.                                                                                                                                                                                                                                                                                                                                                                                                                                              | -                                                                                                                                                                                                                                                                    |
| 355 | Johan Börje          | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | Avoidable reversals, interpreted as caused by negligence or inadequate monitoring or storage solutions, should always be fully compensated and should be a risk carried by the party responsible for the carbon storage pool. As suggested in the text, there is no need for a buffer pool for this situation.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                                    |

| 355 | Johan Börje                                     | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | To truly represent a removal, the CO <sub>2</sub> must be removed for at least 300 years, preferably more than 1 000 years, depending on the reading of the half-life of CO <sub>2</sub> in the atmosphere. While the appropriate length needs further discussions in academia, a 300 years bar represents a real challenge for nature-based solutions. The VCM may have to entirely rethink the way it works for nature-based methods, with credits being issued for a pre-defined time span, after which they must be renewed (or to achieve a longer time span, multiple credits have to be acquired for the same emission). | 0                                                                                                                                                                      |
| 355 | Johan Börje                                     | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | For unavoidable reversals, negative emissions with geological storage are, again, different from other mitigation instruments. The main reasons are:                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0                                                                                                                                                                      |
| 355 | Johan Börje                                     | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | · The scientific evidence suggests that the risk of reversal is minimal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0                                                                                                                                                                      |
| 355 | Johan Börje                                     | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | · With already a high cost, adding additional cost will impact the demand compared to cheap off-sets, and will make it more difficult to reach the volumes needed to address residual emissions in time to limit global warming to 1.5 °C.                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                      |
| 355 | Johan Börje                                     | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | · A buffer pool may not be feasible. If, against the scientific evidence, there is an unavoidable event, then the buffer pool may also be consumed. It is not realistic to assume that a project will have the capability to store CO <sub>2</sub> at two different sites, for logistical cost reasons.                                                                                                                                                                                                                                                                                                                         | 0                                                                                                                                                                      |
| 355 | Johan Börje                                     | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | · Governments will be involved in determining how reversals should be handled, with governments taking on the responsibility for reversals, at least after a certain period following the closure of the storage site. These solutions may differ from region to region.                                                                                                                                                                                                                                                                                                                                                        | 0                                                                                                                                                                      |
| 355 | Johan Börje                                     | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | Against this background, the IC-VCM should tread more carefully regarding reversals for negative emissions with geological storage. Specifically, for the EU region any solution must be compatible with the CCS and ETS directive and the CRC-M mechanism.                                                                                                                                                                                                                                                                                                                                                                     | 0                                                                                                                                                                      |
| 355 | Johan Börje                                     | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | ge              | It is also conceivable, considering the current scientific evidence in combination with the expected government regulations mentioned above as well as the need to accelerate demand, that there should be a grace period for negative emissions with geological storage until the regulatory regimes have been established on the major territories for geological storage.                                                                                                                                                                                                                                                    | 0                                                                                                                                                                      |
| 356 | Individual/employee, Perspectives Climate Group | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | te              | Define the term "permanent" in terms of the minimum duration of storage that needs to be guaranteed. 100 years would be a pragmatic approach.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Define the term "permanent" in terms of the minimum duration of storage that needs to be guaranteed. 100 years would be a pragmatic approach.                          |
| 357 | Individual/employee, KOKO Networks Limited      | Section 9 of Assessment Framework and section H of Summary for Decision-Makers | te              | The definition shall also include requirements for continuous and significant positive outcomes. Projects having marginal improvement over the baseline shall be avoided as it becomes difficult to verify that the improvement is attributable to the project activity. CDM tried to address it through the concept of signal to noise ratio.                                                                                                                                                                                                                                                                                  | The GHG emission reductions or removals from the mitigation activity shall be permanent, or if they have a risk of reversal, any reversals shall be fully compensated. |

| 362 | Johan Börje                                | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | For negative emissions with geological storage, the Code should, however, be more ambitious.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                    |
| 362 | Johan Börje                                | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | Regarding the registry itself, there should be a requirement to keep track of all negative emissions rights in the world. Thus, registries should be required to be part of a registry-of-registries. The top-level of such a registry system for negative emissions with geological storage could be maintained by the UN. In the scenario where the notion of double claiming across the corporate and national accounting systems is rejected, for each physical negative tonne there would be two “twin” certificates, connected to one another through a numbering scheme: | 0                                                                                                                                                                                                                                                    |
| 362 | Johan Börje                                | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | · One of the certificates is awarded to whoever has financial control over the value chain, usually the owner of the carbon capture plant. This certificate is tradeable between companies both nationally and across national borders, but only between companies, not between companies and nations or between nations;                                                                                                                                                                                                                                                       | 0                                                                                                                                                                                                                                                    |

| 362 | Johan Börje          | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | With such a set-up, there would be full transparency of the application of negative emissions with geological storage and how the VCM contributes to the achievement of national climate objectives. The question of double counting would be resolved, and it would lay the ground for a much need comprehensive global trade regime between – on the one hand corporations and on the other between nations – that could accelerate the supply and demand of negative emissions. | 0               |
| 362 | Johan Börje          | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | Such a platform for trade in negative emissions with geological storage with standardized certificates driving liquidity, symmetrical information and minimized transaction costs is a missing piece in the current global framework for climate mitigation. In annex, a detailed proposal of what such standardized certificates should include is presented.                                                                                                                     | 0               |
| 362 | Johan Börje          | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | In case Article 6 would need to be amended to allow for such a global trading platform for negative emissions with long-duration storage, governments should, already at COP 27, start a discussion on the necessary adjustments with a view to accelerate the build-out of a global industry for permanent removals that can neutralize residual emissions in time to limit global warming to 1.5 °C.                                                                             | 0               |
| 362 | Johan Börje          | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | As regards Table 24 item c), the criteria should not be whether the project is authorized or not under Article 6, since it may discriminate national and international VCM trade. Thus, the key is not whether a Corresponding Adjustment has taken place or not. The key criteria is whether or not the carbon credit “may contribute to a national climate target”, or not.                                                                                                      | 0               |
| 362 | Johan Börje          | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | ANNEX                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 362 | Johan Börje          | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | The Twin Certificates – Content and Handling                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 362 | Johan Börje          | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | This Annex gives an example of the specifics and the lifecycle of the “twin certificates” envisaged as the foundation of carbon dioxide removals made manifest in the form of standardised and tradable Carbon Removal Certificates for Corporations (CRCCs) and Carbon Removal Certificates for Nations (CRCNs).                                                                                                                                                                  | 0               |
| 362 | Johan Börje          | Section 1 of Assessment Framework and section A of Summary for Decision-Makers | ge              | This Annex is modelled primarily for a BECCS scenario but works equally well for DACCS or any other removal method that would qualify as delivering long-duration storage, typically above 1 000 years of duration, in order to maintain the standardization and, thus, tradability of all certificates included in the system.                                                                                                                                                    | 0               |

They should have independent dispute structures and procedures and must act in a manner that supports local and national government policy objectives.                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 364 | Rosa Maria Roman-Cuesta            | Section 5 of Assessment Framework and section D of Summary for Decision-Makers | ge              | Registry is requested component of a methodological framework to process certified carbon offsets. I am not sure I would present it as a core principle. I suggest we substitute this principle for something more relevant (e.g. certain level of accuracy) and include the registry as a subsection of the No double counting or mitigation activity information principles.                                                                           | I would suggest to consider including the registry as a subsection of the No double counting or mitigation activity information principles.                                                                                                                                                                                                                                                                                                              |
| 365 | Individual/employee, EarthXCG GmbH | Section 5 of Assessment Framework and section D of Summary for Decision-Makers | ge              | It is our opinion at EarthXCG that independence of roles must be considered in terms of methodologies and incentives.                                                                                                                                                                                                                                                                                                                                    | It is our opinion at EarthXCG that independence of roles must be considered in terms of methodologies and incentives.                                                                                                                                                                                                                                                                                                                                    |
| 365 | Individual/employee, EarthXCG GmbH | Section 5 of Assessment Framework and section D of Summary for Decision-Makers | ge              | An emissions mitigation project will almost certainly have a prima facie conflict of interest with the verification process (VVB). However, it is not always the case between the verification and the carbon certificate issuance (carbon-crediting program). Rather, it largely depends on the verification methodology.                                                                                                                               | An emissions mitigation project will almost certainly have a prima facie conflict of interest with the verification process (VVB). | 365 | Individual/employee, EarthXCG GmbH                     | Section 5 of Assessment Framework and section D of Summary for Decision-Makers | ge              | Alternatively, the verification body might not need to be separated from the carbon certificate issuing party if employing a superior methodology. For example, where the verification body utilizes automated sensor data collection and analytics, and makes the data publicly available for audit, then the automatic production of carbon certificates from the standard-attaining operations should be encouraged for its high-integrity, low cost, and scalability. This is the direction that information technology is driving every other industry. It will drive the emissions mitigation industry as well, so it is imperative that it be permitted and even encouraged within the standard. | Alternatively, the verification body might not need to be separated from the carbon certificate issuing party if employing a superior methodology. This is the direction that information technology is driving every other industry. It will drive the emissions mitigation industry as well, so it is imperative that it be permitted and even encouraged within the standard. |

| 371 | Stephanie Sargeant                                     | Section 3 of Assessment Framework and section B of Summary for Decision-Makers | ed              | 'Robust quantification of emission reductions and removals: The GHG emission reductions or removals from the mitigation activity shall be robustly quantified, based on conservative approaches, completeness and sound scientific methods.'                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Add that emission reductions or removals by the mitigation action need to be determined relative to a baseline or reference scenario. Also add that MRV is needed to demonstrate performance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 372 | Ivan VALENCIA                                          | Section 3 of Assessment Framework and section B of Summary for Decision-Makers | ge              | Permanence – The CCPs unduly punish emission reductions from forestry activities in the conceptual framework, and do not acknowledge the existence of reversals in some fossil fuel avoidance activities. This mistake will only perpetuate the impression that land-based mitigation and nature based solutions are less important than other forms of mitigation, at precisely the time when they are most needed not only for mitigation but for adaptation and biodiversity conservation. Further details are in the specific comments section.                                                                                                                                                     | Refer to comment in this section                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 375 | Individual/employee, ANSI National Accreditation Board | Section 3 of Assessment Framework and section B of Summary for Decision-Makers        | ge              | IC-VCM should consider a requirement for Validation/Verification Body (VVB) accreditation by IAF ISO 14065 MLA signatory bodies or a phase-in of such a requirement. In addition, IC-VCM could require in its benchmarking scheme that programs have in place specific rules for the accreditation of VVBs in keeping with international standards, competence and continual improvement of the accreditation system (e.g. the program operator shall inform the AB of relevant information and developments related to its program, the program operator shall inform ABs if a VVB's recognition is removed/revoked, the program operator shall have documented requirements for VVBs to operate in its program including but not limited to a,b,c...). Here IC-VCM should endeavour to work with IAF. Also, it is not apparently clear what is an "accreditation system under the UNFCCC". Is this to imply that UNFCCC will accept other accreditation systems, or is this intended to denote UNFCCC CDM DOEs? The meaning of this sentence is not clear. | Consider requirement that ABs are signatories to MLA for greenhouse gas validation and verification. Clarify the meaning of an "accreditation system under the UNFCCC". |

| 376 | Anonymous                                              | Section 3 of Assessment Framework and section B of Summary for Decision-Makers        | ge              | To highlight some other benefits of using the method-formula in an integrated way, this could increase the research and verification efforts in such formulas because their contributors could gain a share of revenue after credits that are using that formula. If those credits are Swarm NFTs, these payments could be trustless, based on smart contracts. Additionally, by adding the inputs and allowing the algorithms/smart contracts to calculate the CO2e outputs, that will be according to the referenced methodology for sure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                       |

| 379 | Individual/employee, KOKO Networks Limited      | Section 2 and 10 of Assessment Framework and section I of Summary for Decision-Makers | ed              | Applying conservativeness at the expense of completeness and scientific approach could yield drastic results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 380 | Phil Cryle                                      | Section 2 and 10 of Assessment Framework and section I of Summary for Decision-Makers | te              | Consideration should be given to having separate principles for avoiding environmental and social harm and for positive sustainable development (SD) impacts. The avoidance of environmental and social harm is critical to the integrity of the carbon market and so merits being a principle in its own right.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Consideration should be given to having separate principles for avoiding environmental and social harm and for positive sustainable development (SD) impacts. The avoidance of environmental and social harm is critical to the integrity of the carbon market and so merits being a principle in its own right.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 380 | Phil Cryle                                      | Section 2 and 10 of Assessment Framework and section I of Summary for Decision-Makers | te              | The carbon market is (currently) aimed at directing finance to sectors that will provide carbon sequestration and storage benefits, with co-benefits a secondary priority. The carbon market is therefore not focused on, or structured as, a mechanism to mobilise investment in broader nature-based solutions, yet it has the potential to do so. Consideration should be given to explicitly requiring the robust quantification of positive SD impacts under the full threshold or through a ratcheting up of the full threshold to require quantification over time. Requiring quantification of broader environmental, social, cultural and economic outcomes of nature-based solutions would facilitate the emergence of standardised methodologies for assessing co-benefits that have been slow to evolve despite their use internationally, such as in the development of natural capital accounts under the UN System of Environmental Economic Accounting. | The carbon market is (currently) aimed at directing finance to sectors that will provide carbon sequestration and storage benefits, with co-benefits a secondary priority. | 380 | Phil Cryle                                      | Section 2 and 10 of Assessment Framework and section I of Summary for Decision-Makers | te              | Whilst offset projects with broader (i.e., non-carbon) environmental, social, cultural and economic co-benefits currently command a price premium, the absence of robust quantitative information on (the type and magnitude of) co-benefits delivered means that this premium is not a direct reflection of the underlying societal value of individual offset projects and meaningful comparison of the co-benefits across projects is not possible. A requirement under the CCPs' assessment framework's full threshold for robust, quantitative information (or a ratcheting up of the full threshold to require quantification over time) on the type, magnitude and value of co-benefits, using consistent measurement metrics, would facilitate more robust price discovery across varying levels of co-benefits and promote more efficient capital allocation.                                                                                                  | Whilst offset projects with broader (i.e., non-carbon) environmental, social, cultural and economic co-benefits currently command a price premium, the absence of robust quantitative information on (the type and magnitude of) co-benefits delivered means that this premium is not a direct reflection of the underlying societal value of individual offset projects and meaningful comparison of the co-benefits across projects is not possible. | 380 | Phil Cryle                           | Section 2 and 10 of Assessment Framework and section I of Summary for Decision-Makers | te              | Such an evolution of the carbon offset market to mobilise investment in nature-based solutions could arguably still be achieved via tagging "Verified SD Impacts" as an additional attribute under the CCP, but this approach places less emphasis on the importance of quantifying SD impacts of carbon offsetting projects. It is therefore likely to result in a slower evolution of the market and/or sub-optimal capital investment to support nature-based solutions at a time when the loss of natural capital is amplifying the risk to future economic and social prosperity.                                                                   | Such an evolution of the carbon offset market to mobilise investment in nature-based solutions could arguably still be achieved via tagging "Verified SD Impacts" as an additional attribute under the CCP, but this approach places less emphasis on the importance of quantifying SD impacts of carbon offsetting projects. | 381 | Individual/employee, Oxford Net Zero | Section 2 and 10 of Assessment Framework and section I of Summary for Decision-Makers | te              | "The carbon-crediting program shall have clear guidance, tools and compliance procedures to ensure mitigation activities conform with or go beyond widely established best industry best practices on social and environmental safeguards while delivering on net positive sustainable development impacts."                                                                                                                                                                                                                                                                                                                                             | "The carbon-crediting program shall have clear guidance, tools and compliance procedures to ensure mitigation activities conform with or go beyond widely established best industry best practices on social and environmental safeguards while delivering on net positive sustainable development impacts. In addition to this guidance, IC-VCM shall help ensure that any party participating in a trade on the voluntary carbon market is using these credits for residual emissions only, aligned with best-practice guidance from the Science-Based Targets Initiative (SBTi). IC-VCM also aligns with best practice guidance that offsets should not be applied as a reduction towards short-term (interim) targets, as SBTi stipulates." |
| 382 | Oda Almas                            | Section 2 and 10 of Assessment Framework and section I of Summary for Decision-Makers | te              | It is highly recommended that "adherence to international human rights instruments" is adopted as an alone-standing principle due to the importance of carbon credits being produced in a way that does not violate the rights of indigenous peoples and other communities with customary tenure rights (especially their rights to lands, territories and resources). Some of these rights are covered under the social safeguard umbrella, but to clarify against which standard these should ultimately align, it is advisable to explicitly include this as its own principle instead of putting it together with environmental safeguards and SDGs. | New title of principle:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 383 | Ivan VALENCIA           | Section 2 and 10 of Assessment Framework and section I of Summary for Decision-Makers | ge              | Safeguards and additionality – The CCPs are very detailed in these topics and probably and the distinctions between the Initial and Full thresholds are reduced. These are areas where complexity must be reduced particularly for the Initial threshold, otherwise they become a big deterrent for programs to seek CCP certification. GGGI holds the highest standards of environmental integrity but at the same time accompanies developing country governments to initiate projects and reach trades but we are always wary of new badges coming into the market that will then be used as a minimum standards by buyers, being likely very onerous for the sellers to meet.                                                                                                                               | Refer to comments on this section                                                                                                                                                                                                                                                                                                            |
| 384 | Rosa Maria Roman-Cuesta | Section 7 of the Assessment Framework and section F of Summary for Decision-Makers    | ge              | Environmental safeguard should be a principle by itself. At the end, these CCP are referred as "environmental integrity" although they really are "mitigation integrity" Environmental integrity for land use projects should require any credit to guarantee improved ecosystem resilience and ecosystem services beyond the no-harm approach, promoting an adaptation premium.                                                                                                                                                                                                                                                                                                                                                                                                                                | Disaggregate environmental safeguards and create a principle of Environmental Integrity that considers adaptation as a premium, and as a requisite for High-integrity carbon offsets. Natural capital conservation requires active action in mitigation integrity thresholds.                                                                |

| 386 | Paul Renaud             | Section 7 of the Assessment Framework and section F of Summary for Decision-Makers    | te              | It is a bit naive to believe that negative effects, both environmental and social, can be fully mitigated. Every human action occurs at an environmental cost. Mitigation of that cost is possible, but realistically not fully. Even the initiatives that we need to encourage come with an environmental cost. Electric batteries requires mining for battery materials, windmills kill birds, etc. For environmental impacts, it is important to weight the greater good as harms to individuals of a species to protect the entire species may be necessary since climate change can kill off entire species.                                                                                                                                                                                               | Replace the concept of "do-no-harm" with the concept of improved net outcomes.                                                                                                                                                                                                                                                               |
| 387 | Anonymous               | Section 7 of the Assessment Framework and section F of Summary for Decision-Makers    | ge              | A key challenge for integrity is avoiding use of credits for anything other than residual emissions. Whereas in practise, insufficient regulation, competitive pressures and other incentives are guiding emitters in some geographies and sectors to employ credits as a means to continue with business-as-usual rather than do the hard but necessary work of eliminating emissions as soon as possible to reduce public and private risks to society and business. Without a mechanism to ensure credits are only used for residual emissions the misuse of credits to supposedly offset emissions and thereby eliminate harm will continue as will widespread doubts and skepticism about the VCM. If such conditions pertain prospects for rising prices and increasing market activity might be limited. | Mandate (large) emitters to have a third-party reviewed, verified and assess net-zero 2050 pathway as a prerequisite for the right to buy ICVCM approved credits?                                                                                                                                                                            |
| 387 | Anonymous               | Section 7 of the Assessment Framework and section F of Summary for Decision-Makers    | ge              | Integrity surely implies carbon credits which drive action to eliminating emissions rather than providing a cover for business-as-usual. Transparency is essential to promoting quality along the value chain from credit production to final application and retirement. VCM credits are only part of the solution if their use for residual hard-to-abate emissions is beyond repute. Currently, this is not always the case which casts a dark shadow over the market, curbing interest from buyers, investors and potential developers.                                                                                                                                                                                                                                                                     | Establish a framework to link ICVCM approved credits to national or global net-zero 2050 pathways, such as only permitting sales of such credits by developers to (large) emitters with credible net-zero 2050 pathways?                                                                                                                     |

| 389 | Johan Börje          | Section 7 of the Assessment Framework and section F of Summary for Decision-Makers | ge              | However, item Table 50 b) needs more careful wording. It is practically impossible to evaluate whether a resource is efficiently used. The criteria should be "sustainable use" of a resource, such as biomass. In order to make such a criteria workable, the IC-VCM should have a green list of legal regimes which are considered to represent a sustainable management of biomass. In the first release, it is suggested that at least the EU RED directive is included on such a list.                                                                                                                                                                                                                                                                                                                     | 0                                                                                                                                                                                                                        |

| 390 | Individual/employee, Perspectives Climate Group | Section 7 of the Assessment Framework and section F of Summary for Decision-Makers  | te              | The CCPs should clearly define the term “net-positive SDG impacts” as sum of positive and negative impacts. These need to be assessed and demonstrated at target level. An activity can only meaningfully and transparently show a positive impact on the SDGs on target-level, as one SDG usually includes a diverse set of targets. The assessment of positive and negative impacts to determine whether impacts are “net-positive” should always refer to one SDG target. If an activity has impacts on more than one SDG target the “net-positivity” should be assessed for each target separately. | The CCPs should clearly define the term “net-positive SDG impacts” as sum of positive and negative impacts. | 391 | Phil Cryle                                      | Section 7 of the Assessment Framework and section F of Summary for Decision-Makers  | te              | Clarity could be provided as to how “avoid(-ing) locking in levels of emissions, technologies or carbon-intensive practices” would work in practice. For example, if an ARR/REDD+ project undertakes thinning of a forest and the harvested biomass is then sold to a co-firing generator which provide an additional cash flow to the project – would this detract from project quality? Also, without clearer guidance, there is a risk that this principle is misconstrued as reinforcing the frequent criticism that offsets are themselves a mechanism for locking in levels of emissions.         | Clarity could be provided as to how “avoid(-ing) locking in levels of emissions, technologies or carbon-intensive practices” would work in practice. For example, if an ARR/REDD+ project undertakes thinning of a forest and the harvested biomass is then sold to a co-firing generator which provide an additional cash flow to the project – would this detract from project quality? Also, without clearer guidance, there is a risk that this principle is misconstrued as reinforcing the frequent criticism that offsets are themselves a mechanism for locking in levels of emissions.         |
| 392 | Individual/employee, Oxford Net Zero            | Section 7 of the Assessment Framework and section F of Summary for Decision-Makers  | te              | The mitigation activity shall avoid locking in levels of emissions, technology or carbon-intensive practices that are incompatible with achieving net zero emissions by mid-century.                                                                                                                                                                                                                                                                                                                                                                                                                    | The mitigation activity shall avoid locking in levels of emissions, technology or carbon-intensive practices that are incompatible with achieving net zero emissions by mid-century. In addition to this, there must be safeguards in place to protect IPLCs and biodiversity. The voluntary carbon market should not undermine social justice or harm biodiversity.                                                                                                                                                                                                                                    |

| 396 | Aya Yamazaki         | Section 11 of the Assessment Framework and section J of Summary for Decision-Makers | ge              | The fact that the linear path as requested by the SBTi Standard is not the only one to achieve the Paris Agreement goals. In that sense, mention to the standard should not be made in the final CCP in any case.                                                                                                                                                                                                                                                                                                                     | My comment above is just a precaution.                                                                                                                                                                                                                                                                                                                                                                                                  |
| 397 | Anonymous            | Section 11 of the Assessment Framework and section J of Summary for Decision-Makers | ge              | The idea of credit expiry is not new and could be acceptable if designed thoughtfully. However, trying to assess whether a certain project type is aligned with net zero – in isolation – is an impossible task. Net zero strategies are part of a larger portfolio or collective group of activities. Where a business cannot yet transition away from fossil fuel-based energy sources, they may invest in carbon removal projects elsewhere to 'net' out their emissions – which is still in alignment with a net zero transition. | We recommend taking lessons learned from various compliance markets that have implemented such measures to see how different expiry rates have impacted the market and ensure no unintentional harm occurs.                                                                                                                                                                                                                             |
| 397 | Anonymous            | Section 11 of the Assessment Framework and section J of Summary for Decision-Makers | ge              | Furthermore, if we are to pick and choose 'winners' for carbon credits, the losers will be us all as we will fail to meet our climate targets. If we do not allow emissions intensive sectors to access climate finance, they will continue to be high emitting sectors rather than implementing projects and technologies to reduce their impact and ultimately helping to expedite innovation and the energy transition – is that not the entire point of the VCM?                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 442 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers                                                 | ge              | 'Additionality for project-level mitigation activities                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | But if there is no enforcement of the regulation (which is very often the case), or if there is no financial mechanism to implement the activity, then the activity may still be credited. See also next para. This sentence should be adjusted, regulatory additionality cannot be indispensable unfortunately.                                                                                                                        |
| 442 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers                                                 | ge              | In all cases regulatory additionality is indispensable: if an activity is already regulated, it should not be credited.'                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 444 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers                                                 | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Double counting refers to the risk that the same activity or effect to reduce or remove GHG emissions is accounted for twice (or multiple times).                                                                                                                                                                                                                                                                                       |
| 444 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers                                                 | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Double claiming finally, occurs where two entities 'claim' the environmental benefit of the exact same reduction or removal unit.                                                                                                                                                                                                                                                                                                       |
| 444 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers                                                 | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | In our view, double claiming between voluntary corporate offsetting efforts and national NDCs does not pose a risk, at least in developing countries that require additional finance to achieve their NDCs. This is because efforts are only counted once at the level of the NDC of the host country, while additionality is secured by                                                                                                |
| 444 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers                                                 | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | adherence to the voluntary standards. Hence, we encourage many developing countries to take a flexible approach, as allowed by the Article 6 Rulebook, recognizing that voluntary carbon markets can both be a means for corporations to offset their interim or residual emissions and a meaningful contribution towards host country NDC compliance. Countries and investors should report and communicate this in a transparent way. |
| 444 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers                                                 | te              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | As such, double claiming should be distinguished from other forms of double counting that definitely need to be avoided.                                                                                                                                                                                                                                                                                                                |
| 445 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers                                                 | te              | 'E. Mitigation Activity Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | What would such "compelling constraints" be? This seems to undermine transparency.                                                                                                                                                                                                                                                                                                                                                      |

Sustainable Development                                                                                                                                                                                                                                                                                                                                                                                            | This is our preferred way forward. You would need to at least abide by national regulatory frameworks (or illegal). But this is often not enough, hence IFC. IFC is focused on risk mitigation and safeguards (preventing negative impact), so we welcome the additional focus on net positive impact for the SDGs which is dearly needed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 448 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers | ge              | Option 3) a joint approach using option 1 and 2'                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 449 | Stephanie Sargeant   | Part 3: Summary for Decision-Makers | te              | 'C. No double counting'                                                                                                                                                                                                                                                                                                                                                                                                | Conversely, requiring projects to obtain a Corresponding Adjustment could create a sharp chilling effect which cannot be afforded again given the urgency to address climate change. Consider the situation for voluntary carbon projects in industrialized countries during the Kyoto years, from 2008 to 2020 when emission reduction targets applied for most industrialized countries. Neither the VCS nor the Gold Standard at the time banned voluntary carbon projects in the affected countries. Instead, they required projects located in these countries to present what the Gold Standard called "satisfactory assurances that an equivalent amount of [government units] will be retired to back-up the [voluntary credits] issued". In practice, no government has ever offered a retirement commitment from public books of this sort, and both standards remained (mostly) unavailable in the affected industrialized countries. This is not surprising given the considerable capacity needs and transactional costs to governments for validation, monitoring and verification control alone, assuming that they would not give blanket authorization to a specific voluntary standard. |
| 450 | Josiah McClellan     | Part 3: Summary for Decision-Makers | te              | Section c, 3rd para                                                                                                                                                                                                                                                                                                                                                                                                    | The ICVCM should consider the Paris Agreement and company accounting systems as operating in parallel and not connected. Double counting conflicts would only arise when Paris Agreement accounting is based on company accounting. If they remain separate but parallel, no double counting conflicts would arise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 451 | Josiah McClellan     | Part 3: Summary for Decision-Makers | ge              | I, Under robust quantification, last para                                                                                                                                                                                                                                                                                                                                                                              | The ICVCM position on ex-ante crediting is premature. Ex-ante credits become ex-post credits following validation and verification, so the necessary protections against greenwashing can be put in place. The ICVCM should consider scenarios where ex-ante credits are traded (not labeled CCP), but upon validation and verification they can be converted to CCP-eligible ex-post credits. If the ICVCM does not allow ex-ante crediting within CCP, then this will remove ex-ante crediting from the structured, validated methodologies and instead put it into the market itself. Buyers will seek to reduce the cost of crediting and mitigation activity proponents will look for up-front capital to begin mitigation activities. Ex-post credits and CCP-eligible credits will be generated, but the ex-ante crediting agreement will fall entirely outside the governance of the CCP guidance. It will be beneficial for the ICVCM to include ex-ante crediting in the guidance so that ex-ante credits can be generated under the guidance safeguards.                                                                                                                                       |

| 452 | Anonymous            | Part 3: Summary for Decision-Makers | ge              | We could imagine that the accounting side would be of relevance. But as this is on the buyers side, it may make sense to leave this out of scope.                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 452 | Anonymous            | Part 3: Summary for Decision-Makers | ge              | A. Program Governance: To ensure that carbon credits are issued to the correct entity and follow a clear chain of custody, the carbon-crediting program must have appropriate processes in place. Programs should also have liability provisions in the event of erroneous issuance of credits by specifying the party responsible for cancelling the credits or compensating the over issuance.                       | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Please take a better look at what KYC regulation would mean for in terms of benefits but also costs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                             |
| 452 | Anonymous                                     | Part 3: Summary for Decision-Makers | ge              | Sub F: "Carbon-crediting programs play an important role in ensuring that mitigation activities identify, assess and disclose the potential risk of environmental, economic and social harm and implement actions to avoid or minimise them while delivering net positive impacts beyond its GHG contribution." à Should the focus not be on offsetting GHG contribution while at the same time 'do no harm' during implementation of the mitigation efforts? To expect to also be delivering net positive impacts beyond the GHG contribution seems like a bridge to far (for now).                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                             |
| 452 | Anonymous                                     | Part 3: Summary for Decision-Makers | ge              | Sub G: Additionality. If a credit is regulated it is no longer additional. But when does the CCP consider a credit regulated, is this the case with ETS credits, mitigation activities required and regulated by law, or also in case of local policies or recommended and/or subsidized mitigation activities? (or for instance: under the Carbon Farming initiative the EU is proposing to implement).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                             |
| 452 | Anonymous                                     | Part 3: Summary for Decision-Makers | ge              | Sub G: What is the effect when a non-regulated mitigation activity now falling under CCP-eligibility, becomes a regulated activity? It can no longer be CCP-eligible. Is this a 'material change' under 2.3.1/ 3.4.2? When will the CCP-eligibility terminate, immediately or with some delay?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0                                                                                                                             |
| 452 | Anonymous                                     | Part 3: Summary for Decision-Makers | ge              | sub H: Permanence. Not for all credit-types a full permanence is possible, and a system of full compensation for any reversals may be equally impossible if not for practical reasons – limited and timebound supply – alone. When talking about compensation in case of unavoidable reversals, does the ICVCM intend an 'in full' compensation or an 'in part' compensation? The compensation mechanism has a lot of loose ends.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                             |
| 452 | Anonymous                                     | Part 3: Summary for Decision-Makers | ge              | If 'in full', how does the ICVCM foresee that market participants tackle the issue of 'full' compensation? Both in the situation where the carbon-crediting programs, mitigation activity proponents, etc. is the seller and in the situation where carbon-crediting programs, mitigation activity proponents, etc. is acting as an intermediary for the third party 'creators' of the credits, for instance smallholder farmers or IPLC's? Where would the responsibility for this full compensation lie and how can it be done without causing practical or financial difficulties for these parties that – as the ICVCM points out – are already struggling? This would apply to both in kind compensation (replacement credits) as to financial compensation. Full compensation may even mean a business risk for larger companies, it may for instance tie-up capital in long-term financial provisions and/or be a continued financial risk. | 0                                                                                                                             |

| 454 | Individual/employee, Finnwatch       | Part 3: Summary for Decision-Makers | ge              | Under section C on "No Double-Counting" the requirement is adequate, but even if it does not take position on corresponding adjustments, it should require information on whether the credit has been approved by the host government and if the corresponding adjustment has been made. To prevent double use and double claiming the registry should include comprehensive information on retired/used credits (e.g. who has retired the credit, when, for what purpose or on whose behalf).                                                                                                                                                                                                                                                                                                                                                           | Under section B on "Robust Validation & Verification" there should be an explicit mention that ex-post verification/quantification of mitigation activity is required from the crediting programs. This can now be found in the glossary, but the requirement should be explicitly mentioned in the text itself. Also, full verification of all criteria (including additionality) should be required at each renewal cycle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 454 | Individual/employee, Finnwatch       | Part 3: Summary for Decision-Makers | ge              | The section F on "Sustainable Development" is problematic as it combines two equally important but very distinct concepts: human rights and environmental impacts. Both are so important that they should have their own sections. Also, it is very problematic that the document does not refer to the global authoritative standard on business and human rights: UN Guiding Principles on Business and Human Rights (UNGP). The whole section on social safeguards should be based on UNGPs and OECD Guidelines for Multinational Enterprises and OECD Due Diligence Guidance for Responsible Business Conduct. We'd like to point out that the European union will be applying UNGPs (and OECD Guidelines building on UNGPs) to its upcoming CSDD Directive. It would be counter productive for IC-VCM not endorse UNGP based human rights approach. | Under section D on "Registry" there should be a further requirements: 1) registry should be publicly available, 2) registry should include comprehensive information on retired/used credits (e.g. who has retired the credit, when, for what purpose or on whose behalf).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 454 | Individual/employee, Finnwatch       | Part 3: Summary for Decision-Makers | ge              | Comment on section G "Additionality": Additionality should be regularly checked and verified, especially in program type projects, where initial investment is smaller and financial feasibility can be achieved rapidly, when market conditions change. Using market carbon prices as a data point for additionality assessment is recommendable. As the prices are expected to rise in the future, such a benchmark will help to make a difference between additional and non-additional projects in financial analysis.                                                                                                                                                                                                                                                                                                                               | Most importantly we propose a complete rewrite of the third paragraph on page 30: "Mitigation activities should not infringe on the human rights of others. In order to "know and show" that they respect human rights, both carbon-crediting programs and mitigation activity proponents must exercise human rights due diligence in accordance to the UN Guiding Principles on Business and Human Rights. Adverse impacts on human rights to which mitigation activities may cause or , contribute or be linked to must be addressed. Each rRequirements for carbon-crediting programs under this CCP relate to typical human rights dimensions that a mitigation activity may face throughout its operations. Human rights responsibility of carbon-crediting programs and mitigation activity proponents is, however, not limited to those typical human rights dimensions but refers to all internationally recognised human rights. Due diligence against these requirements will enable carbon-crediting programs to ensure mitigation activity proponents address many relevant human rights issues. In particular, carbon crediting programs should also ensure that mitigation activities are carried out in full respect for the human rights, dignity, aspirations, culture and livelihoods of IPLCs and vulnerable groups disproportionately affected by climate change." |
| 454 | Individual/employee, Finnwatch       | Part 3: Summary for Decision-Makers | ge              | Under section I "Robust Quantification" transparency should be required from methodology and quantification. Crediting period duration should take into account project types where financial feasibility can be achieved rapidly, when market conditions change.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | While it is important, it is not sufficient that the program mentions how the stakeholders may contact them                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | The program may also ensure that replies to queries are responded to in a timely manner since at times key investment decisions are to be made based on the inputs received from the carbon-crediting program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | While a fair, effective and transparent grievance redressal is necessary it is not sufficient                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | The grievance redressal system needs to be efficient as well in terms of timely resolution to problem brought to the notice of the carbon-crediting program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | While it is important that the work of VVBs is reviewed by the carbon-crediting program there are other dimensions which also need attention                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The comments which the carbon-crediting program makes on the VVB reports should be substantive and priority needs to be given to highlighting materially significant deficiencies                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | Voluntary Carbon Markets are just what the name indicates i.e. they are voluntary whereas NDC targets agreed upon in international negotiations are translated into compliance by the respective governments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Carbon credits purchased and retired by companies or industries to offset non compliance greenhouse gas emissions should not be reported by these entities to their governments and thus double counting at the international level will be avoided. It is the countries and not the private sector which report emissions at the international level                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | A major challenge faced by registries in terms of regulating double retirement has been brought up by crypto based tokens which retire the carbon credit in registry and then go on to sell tokens based on retired carbon credits which should not be allowed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Crypto based carbon credit tokenization agencies should ensure that they do not retire the carbon credits in registry in the token making process and then sell the token as a retirement in the registry means that the carbon has been used and cannot be available in the market. There is a need to raise awareness among the crypto backed token buyers of carbon assets on the need for due diligence while buying and claiming the retirement of carbon in their name. The ICVCM and VCMI should work with CCPs to raise awareness around this issue                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | IFC risk categorization tool is all right but it cannot be used uniformly in varied geographies and socio-economic settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | While the IFC risk categorization tool may be referred to for ensuring environmental and social safeguards however, it is more critical that there is alignment with the nationally regulatory framework                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | Human rights are for total humanity and not for just 'other' humans as mentioned in the current text on page number 9, line number 16 from top                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | The sentence needs to be rewritten as: "Mitigation activities should not infringe on human rights."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | Three separate criteria that                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | The fourth criteria is providing assurance for permanence through geographic diversification of projects. If all projects (for example forestry carbon projects) are in a single country the risk to carbon credits issued are higher from events (for example forest fires) than as compared to a situation when the projects are spread across several countries and continents. This has been demonstrated during the recent forest fires in United States where it has been reported that a significant portion of the buffer pool maintained under the compliance project may have been removed |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | contribute to the level of assurance of permanence of carbon credits have been listed as follows: duration of commitment to monitor and compensate for emission reversals; strength of mechanisms and incentives to compensate for reversals (discount, insurance, buffer); Institutional stability. However, there is a fourth criteria which may be considered for inclusion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | The carbon credits should be credited to the host nation account and should be counted as part of the NDC of the host country. The companies which buy the voluntary carbon credits can claim this as part of their voluntary actions but should not report this as part of their compliance action. There is no double counting because the countries get to report at the UN but not the corporate institutions                                                                                                                                                                                    |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | Corresponding adjustments should not be a requirement for carbon credits in the voluntary markets. Host country approvals are therefore not necessary for the carbon credits meant for voluntary carbon markets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | The voluntary carbon market may levy a share of proceeds to help assess and then minimise the climate risks associated with the projects which are generating the carbon credits. This approach would fix the responsibility of reporting on this expenditure on the project developer and ensure that the funds are being used for the intended purposes                                                                                                                                                                                                                                            |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | A levy charged to projects to support adaptation action in developing countries is a noble cause but would be difficult to track if the funds are being used for the intended purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Fossil fuel based power plants may be levied a special tax to promote establishment of renewable energy projects and afforestation and REDD projects. This should be over and above the requirement to fully offset their greenhouse gas emissions                                                                                                                                                                                                                                                                                                                                                   |
| 455 | Individual/employee, Climate Connect | Part 3: Summary for Decision-Makers | te              | The carbon projects are already contributing to the mitigation of climate change and cancelling or collecting a percentage of credits to fund mitigation activities seems redundant. Therefore this is not required                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 456 | Anonymous                            | Part 3: Summary for Decision-Makers | ge              | F. SUSTAINABLE DEVELOPMENT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Take into account local contexts                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 456 | Anonymous                            | Part 3: Summary for Decision-Makers | ge              | We understand the local context plays a key role in the definition of positive and negative impacts regarding other aspects of sustainable development, in addition to climate change. So "Net positive impacts on the Sustainable Development Goals" criteria should take into account local contexts. Also, such criteria may not necessarily require measures that go beyond a mandatory requirement. In Brazil, for example, LULUCF regulations are known for being quite strict and would not necessarily require further action, despite enforcement challenges in some aspects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

ALIGNMENT WITH PARIS AGREEMENT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Voluntary projects should not imply additional future obligations for governments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 457 | Anonymous                            | Part 3: Summary for Decision-Makers | ge              | Regarding overall accounting, emission reductions should only be counted once as they occur, but voluntary projects should not imply additional future obligations for governments. As such, corresponding adjustments do not belong in voluntary-private based carbon markets, since such projects are likely to be independent from governments, despite public policy synergies in some cases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Corresponding adjustments do not belong in voluntary-private based carbon markets                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 459 | Anonymous                            | Part 3: Summary for Decision-Makers | ge              | For some activities the enhancement of removals isn't less important than reducing GHG emissions. As long as there are provisions to report reversals (as they occur), hierarchy could be the same as emission reductions in certain cases. If the accounting of removals is only left for later stages or to offset residual emissions, the framework will create a perverse incentive to postpone actions to increase removals, which is not desirable. The framework should encourage the enhancement of removal as soon as possible because, at the worst-case scenario (reversals before 2050 for example) they will buy time for permanent mitigation actions that will require longer term technologies to mature, with positive impacts in radiative forcing (temperature) from the present up to 2050 or to whichever year carbon stocks are maintained. At the best case scenario, the contribution of removals will last for much longer time, since its occurrence (preferably as soon as possible). Other issue is that offsets should not only be restricted to the abatement of residual emissions. The use of credits to offset current emissions for specific periods of time shall be allowed, based on limits for such use, e.g. up to 50% of emissions, etc | Offsets should not only be restricted to the abatement of residual emissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

ROBUST QUANTIFICATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Consider a wide range of alternatives as long as they are consistent with environmental integrity in the project at stake                                                  |
| 460 | Anonymous            | Part 3: Summary for Decision-Makers | ge              | In what concerns baselines, there should be room for a wide range of alternatives as long as they are consistent with environmental integrity in the project at stake, e.g. in some cases “business as usual” is likely to be the baseline, in others recent technological developments may be the emerging common practice, but such a possibility needs to be carefully assessed and should not preclude other baseline alternatives. The key point is ensuring environmental integrity when applying the method, but not excluding approaches conceptually. It is also difficult to understand why the forestry sector, especially the generation of removals, should require an additional group of experts to assess baseline scenarios and why the generation definition of baselines, including in other sectors, would also require an additional check through expert groups. Rather, such work should be part of VVBs, as in any other sector. As for the updating of baselines, it could be a consistent action, provided crediting periods are long enough to reflect potential changes and optimize transaction costs. | 0                                                                                                                                                                          |
| 461 | Anonymous            | Part 3: Summary for Decision-Makers | ge              | H. PERMANENCE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Consider that project participants could have a basket of options                                                                                                          |
| 461 | Anonymous            | Part 3: Summary for Decision-Makers | ge              | As for the need to address the “non-permanence risk” of carbon removals, the buffer approach, already implemented in some standards, such as the VCS, is one of the key alternatives. Nonetheless, we believe project participants could have a basket of options, including other existing approaches, e.g. tCERs and ICERs (CDM) and also innovative approaches, e.g. permanence proportional to the IPCC-based decay times of each greenhouse gas, considering the direct impact on the concentration of GHG in the atmosphere temperature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                          |

ADDITIONALITY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Consider that if properly integrated with national/sectoral policies, carbon projects may provide relevant resources, enabling the implementation of policies/regulations. |
| 462 | Anonymous            | Part 3: Summary for Decision-Makers | ge              | As for regulatory additionality, especially in developing countries, governments should be encouraged to coordinate and optimize public policies and regulation, often based on quite scarce resources, with carbon market mechanisms. So, if properly integrated with national/sectoral policies, carbon projects may provide relevant resources, enabling the implementation of such policies/regulations. Countries may also be discouraged to implement additional policies if such an attitude results in curbing the access to external and relevant funding sources for non-governmental actors. Thus, regulations should not always be considered as the baseline, even though it could be so several situations. There should also be room for integration with NDCs regarding additionality (some NDC covered actions may be additional other may not, depending on the national strategy for implementing NDCs, including synergies with markets.                                                                                                                                                                        | Consider the integration with NDCs regarding additionality                                                                                                                 |

PROGRAM GOVERNANCE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Consider every effort made, taking advantage of as many elements as possible, in what concerns scaling up voluntary markets.                                               |
| 463 | Anonymous            | Part 3: Summary for Decision-Makers | ge              | We understand and have experienced to a large extent, that carbon offset projects and programs require complex but necessary regulatory frameworks, either in voluntary or regulated systems. In such a context, the world has taken more than two decades evolve under several sound schemes, such as the multilaterally based Clean Development Mechanisms, which can currently be used as a voluntary offset source, and also non-governmental systems, such as VERRA’s VCS. Thus, although the ICVCM public consultation documents states that the quality of existing methodologies may not be good enough, we believe this is far from the general rule. In spite of relevant gaps in voluntary or regulated systems, most methodologies have been through a severe level of scrutiny, including independent verification processes. As such, every effort should be made not to waste such a global collective effort, by taking advantage of as many elements as possible, in what concerns scaling up voluntary markets.                                                                                                   | Consider a gradual implementation approach                                                                                                                                 |
| 463 | Anonymous            | Part 3: Summary for Decision-Makers | ge              | Potential gaps that remain on methodologies or other aspects of a scaled effort could be corrected under a gradual implementation approach, providing predictability and consistency to market participants and impacted stakeholders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Develop formal criteria capable of enabling a balanced geographical distribution in governing bodies                                                                       |

| 463 | Anonymous                  | Part 3: Summary for Decision-Makers | ge              | Another key point regarding governance is proper representation of global stakeholders. In general, our experience tells there is still a gap of active participation from entrepreneurs from developing countries and emerging markets, which tend to be or become a key constituency under voluntary approaches. Therefore, it would be important to develop formal criteria capable of enabling a balanced geographical distribution in governing bodies. This is key not only because of legitimacy concerns regarding the largest ever global collective action problem, but also for the actual challenge of scaling mitigation action to an unprecedented global level. This will only be feasible with the engagement in many countries, whose private entities may not yet be so engaged as in more developed economies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | Norway's International Climate and Forest Initiative: FEEDBACK ON THE IC-VCM CONSULTATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | see above       |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | Norway's International Climate and Forest Initiative (NICFI) would like to start by noting that we see great value in what the IC-VCM is aiming to contribute to; building confidence in the voluntary carbon market through a transparent, scalable and high integrity market, where it is easy for companies to understand which programmes produce credits that can ensure high integrity, independently verified emission reductions. We agree that it would be useful to set a threshold for what is high integrity, and thereby undertaking a form of due diligence on behalf of market participants that do not have the expertise or capacity to do so. In our response, NICFI have focused on forest carbon credits, and recognize that some elements of our response may not be directly transferable to other sectors. NICFI has more than 14 years experience working in the forest carbon space for jurisdictional programmes on REDD+ (JREDD), and would like to offer our insights to the IC-VCM work with this in mind. NICFI has for several years worked to push for integrity in transactions, both on the demand and supply side, to build norms in the market that could ensure high integrity.                                                                                                                                                                          | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | When it comes to the consultation we have two fundamental concerns that we would like to highlight; one procedural concern on inclusion, and one on substance linked to the documents presented. To start with the procedural concern, it has come to our attention that the IC-VCM documents (assessment framework, core carbon principles, assessment procedure) have been available only in English until recently. We understand that these have now been translated to Spanish, Portuguese and French and made available on the website (w/c 5 September). However, given that these were not available from the start of the consultation period in all languages, we believe the IC-VCM must extend the deadline in order to have an inclusive consultation process, enabling developing countries, indigenous peoples and local communities a fair opportunity to offer input. On the website, you note that the IC-VCM is providing a credible, rigorous and readily accessible means of identifying high-quality carbon credits. We believe this is only possible with the proper input from all stakeholders, which requires accessible documents in several languages. We would also like to note that given the long and complicated documents being consulted on, 60 days is a very short timeframe to be able to access documents and provide meaningful engagement and input. | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | On substance, our main concern is that the IC-VCM assessment framework as drafted will not be workable for high integrity forest programmes at the jurisdictional scale (see a list further down in the document of examples). We see voluntary carbon markets as an important financing vehicle to get much needed funds to these countries, through recognizing and rewarding them for their efforts, and helping them build on this to further reduce deforestation and drive an inclusive rural transformation. NICFI believe that if we do not manage to make market mechanisms work for high integrity jurisdictional level REDD+ programmes, we will significantly set back financing streams towards these countries and jurisdictions, and thereby also rapidly reduce our chances of meeting the 1,5 degree goal of the Paris Agreement. The IC-VCM should not make new requirements for high integrity JREDD programmes at a time where these need to be scaled up, not held back.                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | NICFI agree that voluntary carbon markets need to have high integrity, and we believe there are the two main criteria that will help drive integrity for REDD+ credits in the voluntary market, and which we did not see reflected in the assessment framework:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |

| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | 1. REDD+ should be done at the jurisdictional/national level. REDD+ as negotiated and established through multilateral processes sets a clear standard that REDD+ should be implemented at national scale, and at subnational level only on an interim basis. This is especially important for consideration of additionality and leakage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | 2. Baseline for REDD+ should be based on a historic average and be updated at regular intervals to reflect increased ambition over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | In our mind, using these criteria as a starting point could help set out a simpler assessment framework that is easier to use and quicker to implement than the assessment framework currently under consultation. A simpler guide will make it easier for companies to navigate an already complex market, and make investments into high integrity Jurisdictional REDD (JREDD) programmes more accessible. A simpler guide will also make it easier for forest countries in their decisions on whether to engage in the carbon market or not, on the assumption that carbon markets can and should contribute to their overall efforts to combat climate change. To offer an example of what we believe could be a useful way of helping guide private sector to high integrity in the market, we believe the Tropical Forest Credit Integrity (TFCI) guide written by eight large NGOs has provided a useful starting point: TFCI-Guide-English.pdf (tfciguide.org). | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | A general comment is that by proposing very detailed requirements in the assessment framework, some of which are not found in existing standards, IC-VCM is moving towards de facto establishing a new standard, and not just be a yardstick for existing standards. This creates uncertainty around IC-VCM's role. On the technical details of the assessment framework, we would like to point to ART and their consultation response to the IC-VCM consultation. We are concerned that if high integrity standards such as TREES would not meet the proposed IC-VCM threshold, it will be a discouraging signal to forest countries of "moving the goalpost", and could reduce willingness to move towards meeting these standards. In addition, it will reduce willingness by private sector buying credits from these programmes. An unwanted scenario is that this could confuse, rather than build confidence in the market.                                     | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | Some examples of where we see that the assessment framework needs amendments to be workable for jurisdictional REDD+ include:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | · Safeguards for jurisdictional REDD+ activities should build on the Cancun Safeguards. These safeguards were especially developed for REDD+ to ensure consistency with existing national and international forest governance frameworks, safeguarding of biodiversity and non-conversion of natural forests, measures to address risk of reversals, ensuring the right of indigenous peoples and local communities to full and effective participation throughout implementation of REDD+ activities as well as their free, prior and informed consent in matters that concern them, all depending on national circumstances and international commitments of parties. These safeguards were developed with REDD+ in mind, given that the Warsaw framework specifies that REDD+ should be at the national level, or jurisdictional scale as an interim, and form a key part of the adopted Paris Agreement.                                                            | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | · Additionality: We believe the additionality of jurisdictional level REDD+ comes from stringent baselines based on historical average. Recent historical average of emissions from deforestation has shown to be the best predictor of deforestation, given that this is done at jurisdictional (preferably national) scale. Comparing deforestation at jurisdictional level to historical average is a straightforward way to show additionality. This also requires regular updating of the baseline, at sufficient frequency. If the baseline is updated at regular intervals, it will drive increased ambition over time as future results – and REDD+ credits – will depend on continued efforts to reduce deforestation. Therefore, additionality can be secured by a) stringent baselines setting, and b) regularly updated baselines showing increase in ambition over time.                                                                                   | 0               |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | · Permanence: 50-100 year permanence requirement is unattainable and costly. Furthermore, it has no basis in existing standards. For REDD+ at the jurisdictional level, crediting programs have reversal buffers based on risk of reversals occurring. Introducing 100 year permanence requirements will exclude REDD+ from meeting the IC-VCM requirements, and do more harm than good in our minds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |

| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | · Leakage: working on REDD+ at the jurisdictional/national level far reduces leakage risks, as accounting happens over a coherent geographical unit subject to the same policy framework. Leakage requirements under standards such as ART/TREES should be sufficient for these credits reaching the market, as it entails countries assessing risks and mitigating them at a level corresponding to parties' actual forest governance arrangements.                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                         |
| 464 | Individual/employee, NICFI | Part 3: Summary for Decision-Makers | ge              | We hope the IC-VCM finds these inputs useful, and use them to consider the best approach going forward to build confidence in the voluntary carbon market.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0                                                                                                                         |
