XXXX is concerned the Assessment Framework may not allow for differences in project implementation within a project type.</li> </ul>                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 3049 | Anonymous            | 0                   |                 | XXXX largely aligns with the CCPs in terms of the requirements for methodologies to be approved, reviewed and updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 3049 | Anonymous            | 0                   |                 | However, at a credit-level, over-crediting risk is a point of contention. XXXX views it a risk factor contributing to credit quality, while under the current CCPs it is also a potential component of eligibility. Without allowing for local or project level nuances the framework may lead to inaccurate assessments of specific projects. Importantly the CCPs can and do mandate strong levels of information provision on all aspects of baseline setting, emissions monitoring and quantification. This enables other participants in the market including ratings agencies to better assess quality and value at a detailed level if required. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 3050 | Anonymous            | 0                   |                 | Sustainable development impacts and safeguards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | However, XXX has several recommendations regarding criterion 7.10. First, we suggest amendments where the crediting programme requires qualitative assessments of SDG impacts. The approved tools to make these qualitative assessments include those by Gold Standard and SD VISTa, however discrepancies may arise given some assessments have higher associated costs than others.                                                                                                                                                                                       |
| 3050 | Anonymous            | 0                   |                 | <ul style="list-style-type: none"> <li>The Core Carbon Principles by their nature should focus on the integrity of the carbon reductions or removals claimed in the first instance.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                          | For example, SD VISTa, arguably the most rigorous SDG claim programme, has extra fees whereas the other options listed (e.g. WRI's NDC-SDG interlinkages tool) is free, but much less rigorous. This could lead to variation in claim quality due both free and paid assessments being allowed.                                                                                                                                                                                                                                                                             |
| 3050 | Anonymous            | 0                   |                 | <ul style="list-style-type: none"> <li>XXXX supports the requirements that publicly available information is provided and monitoring, reporting and verification is conducted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Second, XXX suggests removing the requirement that crediting programmes incorporate evidence-driven procedures using national/local tools and frameworks. This is because national and local SDG impact tools and frameworks vary widely. Many governments have set out their own interpretations of the SDGs and adapted their targets and indicators for their own nations, and the same is true for some local governments. If these are applied, SDG impacts will not be comparable based on their impact to the goals on a global level.                               |
| 3050 | Anonymous            | 0                   |                 | <ul style="list-style-type: none"> <li>We recommend amendments to the qualitative assessments of SDG impacts.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | We also recommend that the requirement for carbon credits to have a net positive impact on SDGs is removed. This requirement creates scope for significant negative impacts to be obscured by incomparable positive impacts. If the only cap on negative SDG impacts is as long as they are lower than the positive impacts, then severe negative impacts could still occur on unrelated SDGs, as well as on the same SDG but according to different indicators. Furthermore, impacts across SDGs and indicators are not comparable because they measure different targets. |

However, the burden created by implementation of this area should not pose a risk to the broader CCP agenda.</li> </ul>                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 3050 | Anonymous            | 0                   |                 | The Core Carbon Principles by their nature should focus on the integrity of the carbon reductions or removals claimed in the first instance. Sustainable development impacts and assessments of performance according to SDGs are secondary. This would ensure the CCPS remain neutral between project types with inherently different co-benefit profiles.                                                                                                                                                                                                                                                                                             | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 3050 | Anonymous            | 0                   |                 | XXXX does not have a recommendation for which option to use to assess alignment with Environmental and Social Safeguards requirements for carbon-crediting programmes in the initial phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 3050 | Anonymous            | 0                   |                 | However, XXXX supports two key aspects of criterion 7.10. First, we approve of the requirement for carbon-crediting programmes to provide publicly available information regarding how mitigation activities align with SDG objectives. XXXXX research suggests that many projects with SDG claims fail to provide evidence for their SDG claims, particularly quantitative evidence. Of the major accreditors (SD VISTa, GS4GG, CAR, ACR, Plan Vivo), only SD VISTa labels/assets and GS4GG-certified SDG impacts/monetised contributions require quantitative evidence.                                                                               | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 3050 | Anonymous            | 0                   |                 | Second, XXXX endorses the requirement that carbon crediting programmes must have provisions for monitoring, reporting, and verification (MRV) - at least for projects that seek to make SDG claims. We find that only two SDG crediting programmes require monitoring and few require verification. The programmes that have these requirements provide more robust publicly available evidence for their SDG claims.                                                  | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3050 | Anonymous            | 0                   |                 | Lastly, we support the requirement that mitigation activities avoid - or at least minimise - physical and economic displacement. BeZero views strong land rights as essential for a ratable project.                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3051 | Anonymous            | 0                   |                 | Transition towards net zero                                                                                                                                                                                                                                                                                                                                                                                                                                            | Therefore, XXX considers it important that clarity is provided regarding the specific technologies which are indeed compatible with net zero targets, as well as guidelines on how to sustainably and effectively harness the intended benefits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 3051 | Anonymous            | 0                   |                 | This section addresses the need to avoid locking in technologies that are not compatible with reaching net zero by 2050. Although this issue does not explicitly feature in the XXXX Ratings framework, there remain points of contention which the CCPs should address.                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3051 | Anonymous            | 0                   |                 | Crucially, the assessment framework is largely qualitative, which makes it unclear how incompatible technologies will be defined and how decisions will be made. The lack of clarity and specific use of terminology may also present market constraints by deterring the scaling-up of certain technologies, augmenting financial barriers.                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3051 | Anonymous            | 0                   |                 | Moreover, XXXX's ratings process has encountered a small number of technologies which we deem to be incompatible with reaching net zero. For example, the development of natural gas distribution networks can lead to its lock-in, relating to both the physical infrastructure and the integration into modern societies and economies. An abundance of natural gas may well delay the adoption of renewable energy and undermine efforts to reach net zero by 2050. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3051 | Anonymous            | 0                   |                 | In addition, the development of renewable energy must be carefully planned to avoid curtailment issues. An example of non-optimal practice is in China, where there have been instances of renewable energy generation plants being built without adequate infrastructure. This has resulted in over-capacity which is unused, and subverts the potential benefits of developing such projects.                                                                        | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3052 | Anonymous            | 0                   |                 | Attributes                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Regarding the type of mitigation outcome attribute, we recommend that the label terminology is adjusted to avoid creating a bias for removals credits, which our research has shown account for just ~7% of the market. XXX suggests that, if the label for nature versus tech is applied to removals, it should also be applied to reductions.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3052 | Anonymous            | 0                   |                 | <ul style="list-style-type: none"> <li>• XXXX endorses the assignment of attributes where possible clearly and data-backed, such as correspondingly adjusted credits.</li> </ul>                                                                                                                                                                                                                                                                                       | We note that some projects combine elements of both reductions and removals. A binary label risks to obscure that. At XXX we use our data on project carbon accounts to assign labels - which should reflect the source of the majority of credit issuance. Additionally, we recommend that the emergent label is removed as it is ambiguous and its application could thus be misleading.                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3052 | Anonymous            | 0                   |                 | <ul style="list-style-type: none"> <li>• We recommend not establishing attributes for more subjective issues like SDGs, which are more difficult to compare.</li> </ul>                                                                                                                                                                                                                                                                                                | More detailed labelling of project types can also provide better context for market stakeholders. An example of a clear and consistent taxonomy is provided by the XXX sector classification system ( <a href="https://medium.com/@bezerocarbon/a-simple-sector-syntax-to-scale-the-vc-m-b2ca9bce379">https://medium.com/@bezerocarbon/a-simple-sector-syntax-to-scale-the-vc-m-b2ca9bce379</a> ). As a hierarchical system it allows for both broad categories (e.g. Nature Based Solutions) and more specific or specialised sub-sectors (e.g. Mangroves). Meanwhile, labels that incorporate differences in ecosystem type enable users to differentiate between types of carbon stock (soils or forests for example) or geographical characteristics (e.g. Grasslands vs Seagrass & Seaweeds). |
| 3052 | Anonymous            | 0                   |                 | XXXX supports the notion of establishing attributes to differentiate credits by type of mitigation outcome. This will bring greater standardisation and transparency to the market, and thereby help it to scale-up. However, on attributes 3 (Quantified SDG impacts) and 4 (Adaptation Co-benefits), it is unclear how this would be measured and verified, and there could be risks to using these labels in the absence of clear accounting measures.              | Similarly, the terminology used for the 'Authorised for other purposes under Article 6 of the Paris Agreement' label should also be adjusted for clarity. We recommend that the label is instead called 'correspondingly adjusted' rather than 'authorised', as authorised could be misconstrued.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 3052 | Anonymous            | 0                                                                                                                                | 0                              |                                                                                                                                                                                                                                                                                                                                                                                                                    | XXX also recommends that the 'quantified SDG impacts' label is not implemented since SDG impacts are not binary. They are difficult and sometimes even impossible to measure, especially quantitatively, and SDG claims and the methodologies used to measure impacts vary widely. Given the difficulty in comparing impacts, a quantified SDG impact label could be misleading and therefore should not be implemented. |
| 3052 | Anonymous            | 0                                                                                                                                | 0                              |                                                                                                                                                                                                                                                                                                                                                                                                                    | Additionally, XXX recommends that the Adaptation co-benefits attribute is not implemented because, similarly to the quantified SDG impacts attribute, adaptation co-benefits are broad and a label would therefore not appropriately represent them.                                                                                                                                                                     |
| 3053 | Anonymous            | 0                                                                                                                                | Alignment with Paris Agreement |                                                                                                                                                                                                                                                                                                                                                                                                                    | Our view is that aligning the CCPs to broader requirements in the Paris Agreement is not necessary to achieve this objective and may present additional obstacles to scaling up. For example, restricting the supply of credits in the VCM could increase development costs for suppliers in host countries.                                                                                                             |

The program should notify the Integrity Council no later than 2 weeks after the adoption of any material change."                                                                                                               | Explain what is considered "material change"                                                                                                                                        |
| 3079 | Anonymous            | 0                                                                                               |                 | On the question in Part 3: "Are there principles, criteria and requirements that are not relevant or should not be included in the draft CCPs and draft Assessment Framework?", the following comments:                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                   |
| 3079 | Anonymous            | 0                                                                                               |                 | · We are concerned about the wording: "The carbon-crediting program shall have clear guidance, tools and compliance procedures to ensure mitigation activities conform with or go beyond widely established best industry best practices on social and environmental safeguards while delivering on net positive". We believe that this could be replaced by a concept similar to the principle of Do No Significant Harm (DNSH) as is articulated in the EU Taxonomy. | 0                                                                                                                                                                                   |
| 3079 | Anonymous            | 0                                                                                               |                 | · We believe that the need to mitigate greenhouse gas emissions has become too large, and the issue too important, to burden carbon credit projects with mandatory contribution to co-benefits such as share of proceeds, or contribution to SDGs. Much damage has been done in, for example the CDM roll-out, by burdening carbon credits projects with mandatory requirements for contributions to sustainable development objectives in some developing countries.  | 0                                                                                                                                                                                   |
| 3079 | Anonymous            | 0                                                                                               |                 | · We think that it is important that carbon crediting programmes have the ability to tag projects to showcase the co-benefits of specific projects. We commend the ICVCS for making such provisions but warn against mandatory contribution of projects to sustainable development. We note that this is currently being implemented by Verra in the VCS, and believe that it will damage the carbon market, and slow down the global decarbonization effort.          | 0                                                                                                                                                                                   |

| 3079 | Anonymous            | 0                   |                 | · It is our reading of Part 2 which describes the Core Principles in the body of the document, and the attributes of carbon credits in the Annex that the ICVCM is aligned with the enforcement of the principles of environmental and economic integrity, and the optional implementation of the principles of social integrity. We think this is the right approach.                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3079 | Anonymous            | 0                   |                 | · We note your question: "The Expert Panel ... considered alternative approaches to assess alignment with Environmental and Social Safeguards requirements for carbon crediting programs during the initial phase" We recommend Option 2): Evidence of alignment with national regulatory framework.                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3081 | Anonymous            | 0                   |                 | CONSERVATISM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | In our minds, it is important to keep the balance between the administrative burden and the application of the principle of conservatism of carbon offset programmes and the accounting for the actual emissions that can be offset. We believe that the ICVCM should guard against forcing carbon crediting programmes to continue with the imbalance that is the result of 2 decades of pressure on the CDM. |
| 3081 | Anonymous            | 0                   |                 | The principle of conservatism is important. It has formed a cornerstone of safeguarding the integrity of carbon credits since the inception of the CDM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3081 | Anonymous            | 0                   |                 | One should however guard against taking the application of conservatism in carbon crediting programmes too far. In principle, a carbon credit is used to offset an actual emission. The development of the CDM has lead to a situation where the administrative burden on the issuance of a credits significantly exceeds the administrative burden with respect to the accounting for the actual emissions that can be offset with the credits. This is also true for the application of the principle of conservatism. Any uncertainty in the carbon credit project leads to a reduction in the amount of credits issued, but uncertainties in the account for the emissions by GHG emitters does not lead to adding emissions to their inventories. | 0                                                                                                                                                                                                                                                                                                                                                                                                              |

| 3096 | Anonymous            | GE                  |                 | The structure that ICVCM outlines seems a comprehensive one, giving principles, a framework and governance structure that should lead to a robust market, although the detailed criteria within this framework will be extremely important to get right.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3096 | Anonymous            | GE                  |                 | In contrast, the current market is unregulated, has self-appointed review bodies, and in some cases is ascribing carbon credits to projects which at face value will not contribute to addressing climate change. Many 'carbon reduction' projects have questionable additionality as they would have happened anyway (due to regulation) or are payments to prevent actions such as deforestation. These projects thereby offer carbon credits at low prices and allow purchasers to claim carbon neutrality at low cost, despite the dubious impacts of those investments. This devalues our whole industry and dampens demand for and public support of carbon credits.                                                                             | 0                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3096 | Anonymous            | GE                  |                 | The quicker a robust over-arching structure is put in place whose methodology would bring into question these marginal projects, the more the industry will be seen as a robust contributor to addressing climate disintegration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3097 | Anonymous            | GE/TE               |                 | The growing importance of carbon removals                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3097 | Anonymous            | GE/TE               |                 | If the world is to follow a 1.5°C pathway, we need to rapidly reach Net Zero at a global level. While on the one hand there needs to be a huge focus on carbon emission reductions, which in large part will be brought about through regulation and legislation, achieving this will require all residual emissions to be neutralized by removals. The importance of removals rather than reductions will grow over time.                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3097 | Anonymous            | GE/TE               |                 | In the longer term, when governments and companies will have completed whatever carbon reductions are technically and economically feasible, we will need ongoing, fully compensating carbon removals forever, to offset residual emissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3097 | Anonymous            | GE/TE               |                 | We therefore strongly support the proposal to show carbon removals as clearly differentiated from carbon reduction projects; it is the Attribute we believe should be emphasized above all others.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0                                                                                                                                                                                                                                                                                                                                                                                                              |

| 3097 | Anonymous            | GE/TE               |                 | The Oxford Principles recommend an investment transition over time in purchases away from investing in reductions to focus solely on removals, as more investment opportunities open up. We recommend the ICVCM also champions this transition.                                                                                                                                                                                                                                                                                                                                  | 0               |
| 3097 | Anonymous            | GE/TE               |                 | XXXX is recommending that all companies have a Net Zero plan in place that identifies how they will reduce their emissions to a minimum and hence what residual ongoing carbon removal mitigation purchases they will need. We recommend that they start investing in that level of negative emissions now, not in 2050, to have a more immediate impact but also to underpin the growth and increasing cost efficiencies of a market that will need to exceed 5 gigatonsCO2pa by 2050 according to the IPCC.                                                                    | 0               |
| 3097 | Anonymous            | GE/TE               |                 | We suggest the ICVCM is equally clear about the growing importance of negative emissions. Purchasers need to understand the difference between reductions and removals. Policy that encourages the rapid growth of the carbon removals markets may also help deliver greater optionality; the ability to ramp up negative emissions to try as far as possible to offset any failure to reduce emissions as fast as is required to remain within 1.5 degrees global warming.                                                                                                      | 0               |
| 3098 | Anonymous            | TE                  |                 | Additionality and permanence of engineered carbon removals                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 3098 | Anonymous            | TE                  |                 | We believe credits arising from engineered carbon removals with permanent geological storage, in contrast to emission reduction credits, are fundamentally additional. This is because there is no incentive for a developer to carry out these activities without the revenues from carbon markets.                                                                                                                                                                                                                                                                             | 0               |
| 3098 | Anonymous            | TE                  |                 | So engineered carbon removal with permanent geological storage (i.e. DACS and BECCS, including biogenic energy from waste) should pass the test for “very high likelihood that the type of mitigation activity is additional”.                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 3098 | Anonymous            | TE                  |                 | As the ICVCM looks to consider the verification and monitoring processes for engineered removals, they may wish to focus in particular at the upfront geological conditions that need to be met that give high levels of confidence geological stores will result in permanent storage, which will then allow for a lower, appropriate and commensurate level of ongoing monitoring of stores. ICVCM standards and risk assessment should also take into account the high level of regulatory oversight that engineered removals an geological storage will have to comply with. | 0               |
| 3099 | Anonymous            | GE/ED               |                 | The additionality of Government-backed projects                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 3099 | Anonymous            | GE/ED               |                 | At present, the vast majority of carbon removal projects are not economic; the carbon price is simply not high enough to fund the schemes.                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 3099 | Anonymous            | GE/ED               |                 | The markets are therefore being significantly advanced by government support; by way of long term contracts (such as Contracts for Differences in the UK) or tax breaks (such as 45Q in the US).                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3099 | Anonymous            | GE/ED               |                 | However, under the ICVCM proposals, there seems a high risk that these schemes would not be considered additional, because it is likely they would be deemed economic without the sale of negative emissions, because of the level of Government support.                                                                                                                                                                                                                                                                                                                        | 0               |
| 3099 | Anonymous            | GE/ED               |                 | This would seem a perverse outcome, when the prime objective of Government support is to encourage the growth of a broad and ultimately free-standing market. Their support assumes that over time, within a particular project and/or across programmes, negative emission revenue revenues will obviate the need for further government support.                                                                                                                                                                                                                               | 0               |
| 3099 | Anonymous            | GE/ED               |                 | We suggest the risk of this perverse outcome is addressed through the combination of two rules:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |

| 3099 | Anonymous            | GE/ED               |                 | However, this does not mean they are no longer additional, because there is no incentive for a developer to carry out these activities without the revenues from carbon markets. In fact, such an approach would again be self-defeating; precisely at the point when a technology becomes economic it would risk cutting off the funding source that got it there!                                                                                                                                                                                                                                                                                                                              | 0               |
| 3099 | Anonymous            | GE/ED               |                 | Carbon removals with higher returns must therefore still be classified as additional. This has two implications:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |

This will allow investors in carbon removals to determine whether they wish to prioritise technologies whose economics are more challenging, to encourage growth across markets, rather than invest in project with better returns</li> </ul>                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3099 | Anonymous            | GE/ED               |                 | <ul style="list-style-type: none"> <li>• If projects can become profitable and remain additional, this will incentivise further investment into that particular technology, increasing competition, investment and further cost efficiencies. This surely is the result we are looking for; the greatest amount of investment possible into the most economic carbon removals. This can only be the case if projects with positive IRRs are still considered as additional, funded by the carbon markets we are looking to develop</li> </ul>                                                                                                                                                    | 0               |
| 3100 | Anonymous            | GE/TE               |                 | Conditions for permanence                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 3100 | Anonymous            | GE/TE               |                 | We welcome the idea of a risk-based approach in terms of quantifying carbon credits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 3100 | Anonymous            | GE/TE               |                 | This risk-based approach seems particularly relevant when assessing the likely permanence of removals, where only very long-term removals can ensure enduring climate impact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3100 | Anonymous            | GE/TE               |                 | Given this, we would hope that the ICVCM will follow the approach under the Oxford Principles that recommends an increasing allocation of investment into permanent negative emissions, particularly geological storage, as corporates and governments look to increase their investment in carbon removals.                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 3100 | Anonymous            | GE/TE               |                 | In the long term, to be truly carbon neutral, all residual emissions will have to be 100% mitigated through permanent carbon removals, not through investment in reductions, which do not negate the impact of the residual emissions. This is why we strongly encourage the ICVCM to focus on carbon removals as an attribute, where investors should be encouraged to invest now in the levels of removals that will need longer term to mitigate their long term residual emissions. Such an approach of immediate investment at their long term sustainable level will help fund and encourage material investment in carbon removals.                                                       | 0               |
| 3100 | Anonymous            | GE/TE               |                 | On page 34 of the consultation, the ICVCM contrasts the permanence of carbon reduction on the introduction of solar panels versus the reversal risks of forest mitigation, with the implication that the former is better than the latter. We consider this to be the wrong way round. Investment in solar panels will indeed reduce carbon emissions, but will not mitigate the emissions of the purchaser. In contrast to the implication of the consultation, it would be better to invest in the actual carbon removals of nature-based solutions which do mitigate emissions, with those removals subject to the measures and governance needed to ensure the permanence of those removals. | 0               |
| 3100 | Anonymous            | GE/TE               |                 | The whole of the carbon market should be focusing on a rapid transition away from carbon reductions (which more and more will be required by regulation and legislation anyway and therefore should not be considered as additional) towards carbon removals. We recommend the ICVCM make this emphasis a key priority.                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3101 | Anonymous            | GE                  |                 | Permanence in nature-based solutions and the administrative burden of certification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3101 | Anonymous            | GE                  |                 | Investment in nature-based solutions – in particular afforestation and mangrove planting that is truly additional – offers huge global potential to quickly and affordably contribute to staying within the 1.5 degree target. It also offers the opportunity for the international transfer of funding from richer countries and companies looking for removals to less well developed countries that have the greatest potential for afforestation, the best climates for growth, and would reap the greatest biodiversity benefits from that investment.                                                                                                                                      | 0               |

| 3101 | Anonymous            | GE                  |                 | We therefore are great advocates of global investment in nature-based solutions and strongly support the ICVCM's clear priority on managing environmental, economic and social risks, including working conditions, pollution prevention, land acquisition and involuntary resettlement, biodiversity conservation and support of Indigenous People, local communities and cultural heritage. Mitigation activities should not infringe the human rights of others, but more than that, the success of carbon removal schemes should be founded on the support and hard work of local communities, looking to preserve and enhance their habitat. Informed consultation and participation (ICP) and free prior an informed consent (FPIC) are absolutely critical.                                                                                                                                                                         | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3101 | Anonymous            | GE                  |                 | However, while on the one hand we think the governance, review and verification framework the ICVCM is recommending will be critical in re-benchmarking the industry, to ensure that future carbon credits are truly environmentally meaningful, on the other hand, we do have a concern that the governance recommended, procedures, information requirements, registration, and ongoing reporting requirements may together prove an insuperable barrier to some regional investment – particularly those with less reliable institutional support – preventing them from attracting carbon credit funding. When assessing permanence in those regions, there is a concern that the duration of the commitment to monitor and compensate, the incentives to compensate for reversals, and the institutional stability will not be considered to be as strong as elsewhere. This might limit the transfer of funds to particular regions. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3101 | Anonymous            | GE                  |                 | We therefore recommend the ICVCM also considers a volume discount approach to its risk-based methodology; i.e. giving credits of only a limited fraction of a total scheme, commensurate with the risks of reversal and recognizing that many of the ICVCM's recommended ongoing governance may be less effective in that region. Under this discounted approach, where a risk-based approach will raise concerns that an ongoing re-instatement obligation may be hard to monitor and enforce, credits could be given with a deep discount, reflecting a risk-based assessment of the reversal risk. This approach might allow wider access to carbon removal funding, remove perceived barriers, and would involve the potential for far higher levels of carbon removal than accredited, should those reversals not occur.                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3101 | Anonymous            | GE                  |                 | This approach differs from the temporary crediting approach, which still requires levels of ongoing monitoring. The temporary credit approach gives assurance of the full amount of carbon removal for a limited period of time. The discounted approach gives a limited amount of credit to a far larger removals programme but with no time limit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3101 | Anonymous            | GE                  |                 | Perhaps the best, risk-adjusted approach is to apply a volume discount together with a governance review appropriate for the country and project in question.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3103 | Anonymous            | Ge                  |                 | Identifying integrity in high-durability carbon removals                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | If the CCPs are to play a significant role in supporting the growth of high-integrity carbon removals and defining the quality criteria needed in future compliance markets, the IC-VCM must address these questions head on. Failure to do so will slow the development of carbon removals at a time when this industry urgently needs to grow and at a faster pace than we have seen with solar and wind to play the climate role expected of it. |
| 3103 | Anonymous            | Ge                  |                 | We welcome the distinction between carbon reductions and removals in your proposed attributes for carbon credits. Both are needed to reach net zero but have different purposes as carbon credits, as well as different quality and integrity criteria. To understand those criteria, we believe the distinction you make between nature-based and tech-based removals is outdated and unhelpful. It plays into polarized perspectives on the role of nature-based solutions in climate action. It also ignores the complexity of emerging carbon removal approaches, many of which use a combination of nature and engineering (see, for example, biochar, enhanced weathering, BECCS).                                                                                                                                                                                                                                                   | There's a growing scientific consensus that we need to move from reduction measures to removals to achieve net zero. While it is the role of IC-VCM is to set standards for all types of credits, we would expect IC-VCM to explicitly support the need to shift towards removals over time.                                                                                                                                                        |
| 3103 | Anonymous            | Ge                  |                 | Most importantly, the distinction does not help to answer the core questions we need to ask if carbon removals are to neutralize fossil emissions as the IPCC, SBTi and UNFCCC state is unavoidable. For that, we need to know if the project effectively removes carbon dioxide from the atmosphere (with science-based methodologies to measure and verify that), for how long it will do so (is the durability decades, centuries or millennia) and how high is the risk of reversal.                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 3104 | Anonymous            | Ge                  |                 | Additionality has been at the heart of improving integrity and ambition in the VCM – requiring proof that a reduction or removal would not have happened without the revenue from the carbon credit and that the baseline on which this decision is made is sound. It makes sense that this is your first CCP. Your risk-based approach also makes sense, removing the burden of detailed financial and market analysis from credit types that, by their nature, have a high likelihood of additionality.                                                                                                                                      | 0               |
| 3104 | Anonymous            | Ge                  |                 | We believe high-durability carbon removals, as a credit type, are fundamentally additional and should be considered as a low-risk category where a simplified financial additionality test is sufficient. The counterfactual baseline for high durability removals is simply business as usual. There is no incentive for a developer to carry out these capital-intensive activities without the revenues from carbon markets. Even where jurisdictions have introduced incentives for removals, these are not sufficient for financial viability on their own.                                                                               | 0               |
| 3104 | Anonymous            | Ge                  |                 | The complicated rules for proving “medium likelihood” additionality are not appropriate for an industry that is too immature to have standard and reliable IRR and market penetration data. Our projects are among the most advanced on the market, but they are first-of-a-kind. That means we are using them as a test-bed for scaling up volume and bringing down cost – nth of a kind costs and returns will be very different.                                                                                                                                                                                                            | 0               |
| 3105 | Anonymous            | 0                   |                 | Avoiding double-counting through Article 6                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 3105 | Anonymous            | 0                   |                 | Avoiding double counting is crucial to the credibility of carbon markets and to their contribution to tackling climate change. When corporate climate accounting through robust VCM registries and climate accounting at national level are kept separate, the question of double counting (including double issuance, double claiming and double use) is straightforward, and we strongly support the principles proposed. We also support your requirement to have full transparency on identifying any Article 6 authorization and whether a corresponding adjustment has been identified.                                                  | 0               |
| 3105 | Anonymous            | 0                   |                 | We urge, however, that the IC-VCM not put in place any quality or integrity rules dependent on a project’s authorization under Article 6 or the notion of double claiming across the two accounting systems. There is still enormous confusion around exactly what Article 6 will mean for government NDCs and corporate claims. Some governments plan to include removals from capital-intensive projects they support in their NDCs and believe the credits can be sold through Article 6 to a foreign corporate, as long as no corresponding adjustment is applied. Other governments worry that this kind of global trade is not possible. | 0               |
| 3105 | Anonymous            | 0                   |                 | Carbon removals need to be thoughtfully considered in international policy frameworks, so that suppliers can operate and trade globally, governments and corporate buyers are clear on how to navigate claims, there is full transparency and stringent principles are in place to avoid double counting.                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3106 | Anonymous            | 0                   |                 | Raising ambition on permanence                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3106 | Anonymous            | 0                   |                 | We believe that stringent and robust permanence criteria should be at the heart of carbon removals. As with additionality, we believe this should be risk-based. The large-scale removals projects that our companies are implementing – biomass energy with carbon capture and storage, direct air capture and storage, and enhanced weathering – all have very high durability storage in the geosphere rather than the biosphere, and the risk of reversal is tiny.                                                                                                                                                                         | 0               |
| 3106 | Anonymous            | 0                   |                 | Building obligatory and significant buffer pools is certainly relevant for low-durability, high-risk and low-cost removals. For high-durability removals where costs are high and risks are low, a buffer pool is not an adequate solution, and the economics would be challenging.                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3106 | Anonymous            | 0                   |                 | We would also urge the IC-VCM to recognise that many jurisdictions already have or are developing stringent regulatory regimes for dealing with long-term geological CO2 storage liability, and should work within the framework of those requirements, where they exist, rather than cutting across them or adding additional requirements.                                                                                                                                                                                                                                                                                                   | 0               |
| 3106 | Anonymous            | 0                   |                 | High-durability carbon removal technologies – the kind we will need at scale to neutralize residual fossil emissions – are at an early stage of deployment and face uncertainties in potential revenue and cost structure, while often requiring billions in investments. It is hence critical that the work of the IC-VCM sets the right conditions for these technologies to thrive.                                                                                                                                                                                                                                                         | 0               |

|------|----------------------|---------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| 3117 | Anonymous            | ED                  |                 | ICVCM requirements should not include “additionality” because this is a misguided concept that is focused on why emission reductions are implemented rather than how much emission reductions are implemented. ICVCM requirements should be inclusive, covering all types of emission reduction actions, each counted once regardless of motivation.                                                                                                                                                                                                                                                                                                                                                                                                           | Recommendation: Do not include “additionality” in the ICVCM requirements. |
| 3117 | Anonymous            | ED                  |                 | Additional discussion of problems with concept of additionality: In nearly every case involving investment to reduce energy use, the economics of the endeavor are considered in total. The economic return is made up of cost reduction, utility rebates, and the economic value of credits, which must collectively exceed the investment over some period of time that is shorter than other uses of the capital. It is impractical to determine if the decision to approve the de-carbonization investment hinges on the increment of the value of the carbon credit. The entity issuing the credit cannot possibly know if the credit was solely responsible for the project approval.                                                                    | 0                                                                         |
| 3117 | Anonymous            | ED                  |                 | If the project does indeed hinge on the availability of a credit, then the project also hinges on other contributions to the economic return. If asked the question – “Would this investment happened without the credit?” – the investor would surely respond “Yes” if they knew that the credit would not otherwise be issued. But if that is true, we know that the project also hinged on other returns (rebates, lower utility cost, tax incentives) equal or greater than the value of the credit. We would be asking the decisionmaker what was in their head when the decision was made, and they would appreciate that there is an economic incentive to say “yes” to our question, regardless of the truth.                                          | 0                                                                         |
| 3117 | Anonymous            | ED                  |                 | In other words, asking the question encourages a lie if the truth were “no”, and so asking this question creates an incentive for an unwelcome loss of integrity associated with the credit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                         |
| 3117 | Anonymous            | ED                  |                 | Of course, the intent of “additionality” is to enable statistics which attribute reductions in carbon emissions exclusively to the carbon credit, assuring that the environmental impact is not also accounted for by the utility for the rebates they funded, or for the investment, or the tax credits. This can be accomplished by assigning initial ownership of the credit to one entity and tracking its title as the credit is sold to others. There should be only one credit issued for each emission reduction action, to one initial owner, to avoid double counting. This approach establishes “exclusivity” of ownership, which makes sense. Additionality as defined in your document will lower, not raise the integrity of the ICVCM standard. | 0                                                                         |
| 3117 | Anonymous            | ED                  |                 | The carbon credit is an accounting record of the emissions reduction that was measured and verified. To require that the reduction of emissions happened only because of the credit which provides an accounting of the reduction assures that many if not most investors will lie in order to receive the credit. If they tell the truth, that their decision hinged on the many benefits and not the one, most investments would NOT be eligible for a credit under the proposed additionality standard.                                                                                                                                                                                                                                                     | 0                                                                         |
| 3117 | Anonymous            | ED                  |                 | What we need is more economic rewards for investment in carbon emission reductions, not less. Additionality should be removed as a core principle, because it will REDUCE integrity, not improve it. Lower integrity means lower market value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                         |

We agree that persistence should be assessed and become part of the public record associated with the credit, but requiring persistence as a requirement for any credit documenting energy use reduction, or reduction of any greenhouse gas credit is wrong.                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                         |
| 3118 | Anonymous            | TE                  |                 | For carbon that is removed from the atmosphere, and sequestered, sustainability is material, and the provisions described in this Part 2 are relevant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0                                                                         |
| 3118 | Anonymous            | TE                  |                 | Credits should also be restricted to the carbon emission reduction or carbon removal that has actually happened – not what is promised. Like renewable energy credits. Credits based on projections introduce the risk of persistence, which can easily be misrepresented and projected with exuberant optimism. The goal of the ICVCM is integrity – which means that projected results are interesting, should be revealed, but should only be accounted for in credits after they have happened.                                                                                                                                                                                                                                                            | 0                                                                         |

| 3118 | Anonymous            | TE                  |                 | If people wish to speculate on future reductions, they can negotiate for and purchase futures. This is happening today with renewable energy credits. Pre-purchase agreements are commonly negotiated to set prices on future credits, some with pre-payment provisions. Of course, the futures transaction is like any futures contract – the supplier promises to deliver a defined number of megawatt hours, and is obligated to do so by any means necessary, or refund the purchase price accordingly.                                                                                                                                                                                                                                                                                                       | 0               |

| 3119 | Anonymous            | ED                  |                 | We suggest you change these words to “Precise Measurement”. Renewable energy is measured with utility-grade (sometimes referred to as revenue grade) meters. These measurements govern the exchange of a lot of money – they need to be precisely correct, in compliance with meter measurement accuracy standards – typically + or minus 1%. These measurements have integrity defined by the meter measurement standard, with periodic calibration.                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 3119 | Anonymous            | ED                  |                 | How does one measure a mega-watt-hour that has not been consumed? Unfortunately, there are many options, well documented in ASHRAE Guideline 14 and the IPMVP. The United Nations has initiated a project to develop and issue a measurement standard that is unambiguous – without which reductions in the use of energy cannot be quantified using a single “standard” method. This standard is being developed following the ANSI process by an accredited ANSI standards writing body, the Leonardo Academy. A draft will be issued in 4Q 2022 – hopefully in time to be recognized by the Integrity Council in their final documents.                                                                                                                                                                        | 0               |
| 3119 | Anonymous            | ED                  |                 | In Part 4, the draft discusses the certainty of the measurement, which will vary with different credit categories. We recommend that the lowest volume of carbon for which the measurement is confident should become the volume of carbon in the credit. So, if the projected reduction is 100 tons, but the certainty is only 90%, then the credit should be issued for 90 tons.                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |

| 3120 | Anonymous            | ED/TE               |                 | We agree that the public record should include a detailed but brief description of the mitigation activity, and that the ICVCM standard should include broad categories that will be useful to buyers of these credits. We also believe that tagging could be used to distinguish between those credits which are based on revenue quality metered measurements, and those which represent the best estimates. Projected reductions should never become part of any credit.                                                                                                                                                                                                                                                                                                                                       | 0               |
| 3120 | Anonymous            | ED/TE               |                 | We also believe that the time frame of impact (reduced emissions over what period of time, relative to what baseline period of time) be disclosed (vintage). If a credit covers a past time tied to precise measurements, its integrity will be very high. If it covers some future forecast, the credit is clearly a forecast – a promise of future reductions, because one cannot precisely measure future results, and thus disclosure brings into focus a lower confidence level and enables the purchaser to apply the credits to the proper future time frames. In this case, the credit is actually a futures contract, the value of which should be adjusted based on the most up-to-date measurements taken during or after the period covered by the credit.                                            | 0               |

| 3122 | Anonymous            | GE/TE               |                 | Yes, see comments above on additionality and persistence. For a credit that is issued after the impacted time period, based on whole building metered measurements or equivalent, persistence expectation should be disclosed in the record, but it is not material to the value of the credit. Additionality is also a matter of opinion, seldom met in truth, but will be claimed regardless – and for this reason, setting this as a requirement lowers the integrity of the credit. This requirement could become a disclosure requirement, but should not prevent credits from being issued. Given that, we should recognize that the level of detail required by this draft is really way too much effort and discretion relative to the value of the result. Additionality requirements should be dropped. | 0               |

| 3123 | Anonymous            | 0                   |                 | b. We are concerned about the coverage boundaries. Two examples – one can improve the efficiency of a water chiller by simply raising the chilled water setpoint. However, the higher setpoint means that more airflow is required to deliver the same BTU’s to the occupied space. More air means more fan energy. If the boundaries of the credit were only the chiller, a credit would be justified, even though net energy use increased. To resolve this, we should look at the building in total – review the utility meters. Another case involves the company that moved 50 of its employees to a different building, reducing the cooling loads by a material amount. In both cases, no credit should be issued. This question is covered elsewhere in the draft, but only superficially. The requirement for an audit to verify results, needs to consider these questions of coverage boundaries and material changes to demand for services from the building systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3124 | Anonymous            | GE                  |                 | What timeframe would you recommend for the duration of the initial threshold, taking into account the time needed for carbon-crediting programs to revise standards, processes and procedures; carbon-crediting periods; issues related to legal contracts etc.?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3124 | Anonymous            | GE                  |                 | We believe the ICVCM standard should be effective when it is published, and assessments (accreditation) of carbon credits should happen as programs come into compliance. This will take time, but there is no reason to delay assessments of programs which meet your requirements waiting for others that do not. Move forward as quickly as possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3125 | Anonymous            | GE                  |                 | Is this different for different areas of the draft Assessment Framework?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |

| 3126 | Anonymous            | TE                  |                 | In order to accommodate different programs, whose credits have different levels of measurement integrity and risk, the ICVCM standard could establish a minimum level to become accredited, and different integrity rankings. For example, a renewable energy credit which is measured with revenue grade (+ 1%) meters, covering a past measurement period (no persistence issue) should have a AAA rating. A “Building Efficiency Credit” compliant with the standard developed as a project of the UN Secretariat for High Performance Buildings Initiative, would also have an AAA rating, since there is no doubt that reduction in energy use actually happened over the defined time period, relative to a defined and disclosed baseline period. Buyers may be especially attracted to this credit if the baseline period is the same as the baseline for their own reduction objectives. On the other hand, a carbon credit that has only 90% measurement confidence, and a relatively high risk of persistence, would have a lower rating (B).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3127 | Anonymous            | TE                  |                 | We agree with the intent and content of this section, but immediately see the need to sanction secondary counting. This is most apparent in the case of Scope 3 emissions. To site a particular example, EnergyPrint tracks utility use for a client that manufactures windows. Their ESG reporting REQUIRES them to account for Scope 1 and Scope 2 emissions, as well as Scope 3 emissions that are material to the carbon emissions associated with the windows they make and sell. Scope 1 emissions clearly belong to them. Scope 2 emissions belong to them, and the utility that supplies them with electricity. Scope 3 emissions of the glass manufacturers they buy from are huge and need to be disclosed by both companies. The sum of these Scope 1, 2 and 3 emissions represent their carbon footprint baseline. They set a goal of zero emissions by 2050, and 50% reduction by 2030. Reductions of Scope 2 and 3 emissions will be counted toward their objective, since they were included in their baseline. For example, they may purchase Renewable Energy Credits which reduce their Scope 2 emissions. No double counting there. But their electric utility will also make investments to increase the percentage of renewable energy supplied – reducing the window company’s Scope 2 emissions. The credit for this latter reduction belongs to the utility, but is also absorbed to the benefit of their customer. The same is true of their Scope 3 glass supplier, who will surely make investments to reduce or offset their use of natural gas in their glass making operations. | 0               |
| 3127 | Anonymous            | TE                  |                 | We agree that credits should have only one owner, and the aggregation of credits to track progress against goals should include the credit only once. But the credit will be used to contribute to reduction goals many times, because Scope 2 and Scope 3 emissions are included in the baseline of many parties. In other words, the ICVCM must distinguish between ownership of the credit and the accounting of the credit in aggregation of results only once, but accept and accommodate that the credit may be “used” to meet reduction targets many times by different entities whose baseline emissions include material suppliers and customers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |

| 3128 | Anonymous            | TE/ED               |                 | See response to Part 3 introduction question #7 above. To have integrity comparable to Renewable Energy Credits, Carbon credits (including RECs) need to document precisely measured savings that have happened, for which there is no risk. The use of Scope 2 and 3 reductions are required by regulation in some jurisdictions, and by some organizations to be double counted. Some existing carbon offset regulations are based on a projection of the future impact – deemed savings. These circumstances represent different levels of risk, and carbon reductions that occur at different times. To have integrity, credits must carry a risk assessment, a time of impact, a baseline time of comparison, and an obligation to issue a corrected value if actual results are different than projections. Without these disclosures, credits will have no credibility - no integrity – and without integrity, the value of credits will be dramatically diminished because the buyer will not know what they are getting for their purchase. | 0               |
| 3128 | Anonymous            | TE/ED               |                 | We suggest that the ICVCM make it clear, that “deemed savings” that are tied to an estimated projection of savings in the future may not be considered in any carbon credit. We recognize that this is it’s said in other words, but it belongs up front.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3129 | Anonymous            | GE                  |                 | Do you anticipate that there will be challenges in meeting the Sustainable Development requirements in the draft Assessment Framework under the initial threshold? If you do, could you provide information on those challenges.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 3129 | Anonymous            | GE                  |                 | Certainly, every aspect of the draft will be challenged by those whose organizations’ self-interests are not supported by the proposed rule. For example, those who issue RECs will prefer that carbon credits are not available to compete for the funds currently spent to purchase RECs. Those with programs that do not comply with the draft will object to those requirements they do not comply with. Utilities and regulators who do their accounting for deemed savings will also not be happy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 3130 | Anonymous            | GE                  |                 | Should mitigation activities created and managed by IPLCs be subject to differentiated safeguards requirements?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3130 | Anonymous            | GE                  |                 | No. A rule for one is a rule for all. Selective or discretionary enforcement is unfair. One set of rules. One policy of compliance and enforcement for all.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3131 | Anonymous            | GE                  |                 | If so, how would you recommend that the application of free, prior and informed consent (FPIC) is addressed in carbon crediting program guidance and mechanisms to ensure that relationships with IPLCs are based on informed consultation?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3131 | Anonymous            | GE                  |                 | We have no idea what issue is implicit in this question. We strongly urge the ICVCM avoid the use of lettered acronyms, because they are a foreign unintelligible language to many of your audience.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3132 | Anonymous            | ED                  |                 | Additionality requirements as defined in the draft should be dropped, as they are impractical and run counter to the integrity mission of the ICVCM. An alternative approach is to stipulate that the credit will encourage investment and behavioral changes that reduce carbon emissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3133 | Anonymous            | GE                  |                 | Are there any specific criteria which the draft Assessment Framework should take into account in its guidance on additionality?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3133 | Anonymous            | GE                  |                 | No. Drop it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 3134 | Anonymous            | GE                  |                 | The Integrity Council proposes in its draft Assessment Framework a risk-based assessment of additionality, to be conducted by the Expert Panel by project type, as a first step in the overall assessment of additionality for CCP. a) Please provide comment as to the feasibility and desirability of this additional level of risk-based analysis by project type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 3134 | Anonymous            | GE                  |                 | We see no benefit to additionality – it reduces integrity by encouraging misrepresentation (lying). It is subjective. It adds no value, so long as double counting is covered. It reduces the funding of credits, thus reducing the incentives driving results. It will not be enforced objectively, so it will lead to many undesirable results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3135 | Anonymous            | GE                  |                 | b) In this assessment, the Integrity Council proposes to use as one data point analysis of carbon prices. Please provide comments as to the feasibility of use of this indicator, and on the alternative use of marginal abatement costs for this purpose.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |

| #    | Comment submitted by | Para/Fig/Table/Note | Type of comment | Submitted comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Proposed change |
|------|----------------------|---------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| 3135 | Anonymous            | GE                  |                 | The market value of carbon credits responds to supply and demand – as such provides feedback regarding action – as prices rise, the incentive to invest also rises, and vice versa. It’s a self-correcting system – as it should be. The differences in prices paid for different rated or tagged credits, or for credits covering different time periods, is also helpful, because these differences reflect relative integrity and perceived risk – excellent feedback. Marginal abatement costs are also interesting, but their use in setting the value of efficiency credits implies control that defeats the competitive impetus of the market. Tracking it publicly will inform investors where to invest – which is good.                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 3136 | Anonymous            | GE                  |                 | We do not understand why the committee cares about additionality. “Additionality” is a misdirected concept focused on why emission reductions happened rather than the quantity of emission reductions have happened. The comment below (in red) addresses the suggested benefits documented in the draft. Remember that the overarching goal is to maximize the reduction of carbon emissions as soon as possible. The benefits described are tested below against that objective.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3137 | Anonymous            | GE                  |                 | It is impossible to objectively determine why the decision was made to engage in mitigation activity and investment, because benefits are many and varied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3138 | Anonymous            | GE/TE               |                 | The Standard should require disclosure of the mitigation activity, and the process of third-party verification should assess if the carbon reduction claim could reasonably be the result of the mitigation activity. Beyond this, nobody but the individual who made or influenced (recommended) the decision to proceed can possibly know what incentive drove the decision over the top – normally any of several benefits mattered sufficiently to have driven the decision. To require disclosure of this motive invites misrepresentation that reduces the integrity of the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3139 | Anonymous            | GE                  |                 | By this logic, all credits will increase global emissions. You cannot have it both ways. The logic is false. The more credits there are, the more money is being poured into reduction efforts. Wasting time (of everyone) dealing with these kinds of question, raises the engineering and administrative cost to be above the value of the credit. If the reduction can reasonably be attributed to the mitigation activity, it should qualify.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 3139 | Anonymous            | GE                  |                 | The Verification of the claimed carbon reduction still must be done by a qualified entity that is accredited for this purpose. For example, if the occupancy of a building is reduced from 1000 to 500 people, and part of the reduction of energy use is due to this reduction, the mitigation measure must include a pro-active effort to reduce occupancy – for example, by instituting a work-from-home policy A credit covering the measured reduction in energy over a past period would be appropriate. The persistence would be low – over time, the building will fill with people from other companies. This must be disclosed. However, it does not alter the benefit in the measurement period of the reduction in carbon. In the following year, if population rises to 750, and carbon emissions rise, the carbon credit for the new measurement period will be less – tied to 750 vs 1000 people. Each credit covers one defined period. Neither credit speculated about the future, nor do they include projected future savings. They are accurate and credible – they are what is true. Betting on the future performance has very low integrity and should not be allowed. | 0               |

| 3140 | Anonymous            | GE                  |                 | We disagree. Government mandated reductions in carbon emissions require accounting of emissions reductions. The use of Renewable Energy Credits which must be retired by the regulated entity is common practice in the USA by utilities to meet their requirements. The double counting rules proposed in this draft will prevent the double use of a credit. How does the regulated entity comply? They make investments in carbon mitigation programs, including investments in renewable energy. The renewable energy they generate results in credits issued to them. When they use these credits to show compliance, the credits are retired. A credit can only be issued once and retired once. Imagine that they generate more carbon reductions than the regulation requires – they have excess credits which they can sell. It makes sense to allow the satisfaction of these mandatory requirements to include participation with the carbon credit markets, and the integrity requirements that are in play when credits are used to show compliance. Of course, regulatory requirements will logically drive up demand for credits, increasing their value, increasing the funding of de-carbonization efforts. This is a good thing. The more valuable credits become, the greater the incentive for the regulated entity to invest in de-carbonization projects for their compliance rather than purchase credits. | 0               |
| 3141 | Anonymous            | GE/ED               |                 | The use of an additionality test is a wet blanket on participation in carbon credit activity. It is a disincentive, and invites reduced integrity. It will reduce investment in mitigation, rather than increase it. Administration of this question is a tar-pit of controversy, that limits participation in the very program you hope to inspire. It just makes no sense by driving up the compliance cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3141 | Anonymous            | GE/ED               |                 | The ICVCM standard should support its own mission, which is to minimize carbon emission increases. Period. ICVCM should be inclusive covering credits for all types of emission reductions. The sources of carbon emission reductions and the influence of other like-minded programs should be welcome, not disdained. More money feeding into de-carbonization investments is good, not bad. Limiting participation in the carbon market does not expand investment – it retards it. Hearing arguments to the contrary is like calling white .... black. Limiting is not expanding. It grows from a fear that others will game the system (which other integrity provisions prevent) and forgets that the mission is to maximize participation, to drive carbon reductions as fast and as large as possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3141 | Anonymous            | GE/ED               |                 | We recommend against including “additionality” in the ICVCM requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 3142 | Anonymous            | TE                  |                 | The simple solution with the highest integrity is for ICVCM to continue REQUIRING all credits to cover a specified period relative to a second specified baseline period, with both periods in the past. If the two periods are in the past, then permanence is a given. If a proposed credit is speculating about a future period of time, it should not be allowed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3142 | Anonymous            | TE                  |                 | Renewable Energy Credits and Building Efficiency Credits describe metered measurements of utility use in some past period, relative to another past period. Permanence is not an issue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3142 | Anonymous            | TE                  |                 | A credit, for example, associated with a forest being planted logically describes the carbon removal and sequestration of the trees, which increases each year going forward, then stabilizes, when the loss of trees to death and rot are compensated for by natural re-growth. Of course, the risks are many. Fire, and logging are possibilities. So, what can the owner of the credit retire to show compliance with their goals, or regulatory requirements? Each year, they should be able to retire only the carbon associated with that year in the life of the new forest. Each year, the size of the credit should be adjusted (by an accredited third party) to match the reality measured to the best of their ability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 3142 | Anonymous            | TE                  |                 | Regardless, permanence is important to disclose, but it is not material to amount of carbon reduction claimed on a credit, since the credit should cover only the carbon that has already been removed. Predictions of future removal belong in a futures contract that is eventually fulfilled by credits that are based on what has actually happened.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3142 | Anonymous            | TE                  |                 | If changes happen (like a forest fire) – the credit value after the fire MUST be different, as the draft describes. The tougher question – if the forest burns, does the carbon released by the fire belong to the owner of the credit? It should.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |

| 3143 | Anonymous            | GE                  |                 | We strongly agree with this statement found on page 16. "High quality carbon credits are issued based on GHG emission reductions or removals determined ex-post, meaning carbon credits cannot be issued for emission reductions or removals that are yet to occur." We believe that permanence should be disclosed, but we also believe that a one-time event that reduces carbon emissions deserves to be rewarded with a credit for the reduction they delivered, along with a risk assessment reflected in a credit rating. It is important to cover this fundamental point early in the document.                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 3144 | Anonymous            | TE/ED               |                 | Yes. In addition to those activities listed, the exact dates of carbon reduction, and the baseline period (exact dates) which are being compared should be prominently displayed in the credit. Normally, the smallest increment of time that a credit should cover is one calendar month, and we suggest that the longest increment detailed in any credit should be one year. If a credit covers several years, it should list the amount of the credit for each year.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3144 | Anonymous            | TE/ED               |                 | We also suggest that Scope 1, 2 and 3 emission reductions be revealed separately. Note that if a company claims scope 2 and 3 emission reductions in a credit, then those reductions cannot be covered by a credit issued to another entity. It means that Scope 2 and 3 suppliers and customers need to document contractually that credit for the carbon emissions reductions belong to the entity that is including them as their reduction and that the source company cannot claim them themselves.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3144 | Anonymous            | TE/ED               |                 | An example of this would be if a customer funded an efficiency upgrade in the operations of their supplier – since they funded the improvement, the parties agree that the funder will take the credit. As a practical matter, the credit should be issued to the supplier, and ownership transferred at a price (possibly zero) after it is issued.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 3144 | Anonymous            | TE/ED               |                 | If the ICVCM chooses the latter approach (which we would recommend), their requirement would be quite simple – that credits can be issued only for scope 1 & 2 reductions – and scope two credits for reductions in consumption of energy cannot be credited to the scope 2 energy supplier – only to the consumer of that energy. It seems like this clarity is important to be included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3144 | Anonymous            | TE/ED               |                 | Our focus is on Building Efficiency Credits (or Certificates), an initiative sponsored by the UN Secretariat of the High-Performance Buildings Initiative. In buildings, energy use reductions arise from changes in control parameters or automation, equipment efficiency upgrades, building envelope improvements, lighting upgrades, or occupancy changes that result from policy changes. There needs to be an "other" category also. Measurement of energy use is at the utility meter. In the future, credits will be issued for shifting the time of energy use from peak to off peak periods. The Standard draft being developed requires the baseline and measurement period data to be normalized for changes in weather, changes in measurement dates, and changes in production volumes. The public records associated with every credit includes a crisp description of the measures employed to reduce energy use, but the categories listed above seem sufficient for proper tagging. | 0               |
| 3145 | Anonymous            | GE                  |                 | No, since some countries don't have "corresponding adjustments". This is intended to cover voluntary participation – there is no reason to exclude any participant if their country does not support their participation in a carbon offset marketplace.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3146 | Anonymous            | GE                  |                 | No opinion, but we cannot imagine how the "cancellation of carbon credits at issuance" would represent a contribution to overall mitigation. Reducing the funds flowing to pay for mitigation efforts is not good – it's bad. Cancellation of carbon credits at issuance makes no sense. We do think that consolidating data from all entities who issue and track ownership and retirement of credits would be most helpful. The ICVCM should not compete with these entities, whose role it is to issue, track ownership and retire credits, but should work to account for their activity, tied to particular carbon emissions measurement periods and their corresponding baseline periods. And support actions that will increase the funding of improvement projects.                                                                                                                                                                                                                           | 0               |
| 3147 | Anonymous            | ED                  |                 | This requirement," to reduce the baseline by an amount equal to the reduction mandated by law or regulation" should be removed. Of course, this paragraph intends to address the spirit of "additionality" which we do not agree with.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 3147 | Anonymous            | ED                  |                 | Consider two scenario cases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |

|------|----------------------|---------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3147 | Anonymous            | ED                  |                 | In the first case the ICVCM follows the requirement of this paragraph, which eliminates the use of credits to properly account for emission reductions required by the legal or regulatory entity. Let's say that the law requires them to reduce by 100 tons – and they actually reduce by 150. Their credit would be for 50, which they may sell. How do they show compliance with the 100 requirement? In the RECs market, they receive the credit for 100 and retire it. In so doing, the government regulator has all the assurances of integrity the ICVCM standard imposes on their 100 ton claim. Without the 100 ton credit, there is no compliance under your standard, so the regulator has to create their own set of requirements, which might actually refer to the ICVCM document.                                                        | 0                                                                                                                                                                |
| 3147 | Anonymous            | ED                  |                 | In the second case ICVCM enables the use of these credits to prove regulatory compliance. The regulated entity must either invest to cause the reductions, or purchase credits on the open market. To show compliance, they need to retire enough credits to comply. If they earned these credits through emission reduction investments, credits would be issued to them, and retired by them – then there is no exchange of money related to the credits issued. If they did not earn these credits, did not reduce emissions, but instead purchased credits from others and retired them, then they are contributing to the funding of emission reduction investments that others have made and are not taking credit for. What is the downside of that?                                                                                              | 0                                                                                                                                                                |
| 3147 | Anonymous            | ED                  |                 | The advantage of using credits for accounting of regulatory compliance – is the standardization that makes accounting simple. Without the credits for regulatory compliance, the regulator would take credit, but all the safeguards against double counting, measurement uncertainty, documented persistence could be overlooked – not required – and thus the integrity of compliance claims would be lost.                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0                                                                                                                                                                |
| 3148 | Anonymous            | ED                  |                 | Please remove this reference to credits covering future years because this is incompatible with Part 3 Section I, which states, “High quality carbon credits are issued based on GHG emission reductions or removals determined ex-post, meaning carbon credits cannot be issued for emission reductions or removals that are yet to occur.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                                                                                                                                                |
| 3149 | Anonymous            | ED                  |                 | This section is driven by a desire to prevent credits from being issued if the emissions reductions would have happened without investment or the credit. Again, this is just silly. If savings happened, we want the credit to be issued, to give a proper accounting of reductions. Without the credit, how will we track these reductions? Further, asking the question encourages a false answer that supports the issuance of a credit. When added by the ICVCM to other credits, the claim will be that all savings were additional ONLY because of the credit. This statement will often be false – compromising your credibility, and casting doubt on the legitimacy of all credits. Better that your representations be correct – better to say that credits contributed to the decision to invest in all cases, which is true – nothing more. | 0                                                                                                                                                                |
| 3150 | Anonymous            | GE/TE               |                 | We strongly urge that the virtual site visits be allowed. The COVID pandemic has taught us all how to “face-time” a visit, with the on-site person showing us what we need to see, to affirm that the efficiency improvements are in place, that the meter serial numbers correspond to the utility invoices, and that controls are producing the expected results. The rest of the verification process involves an interview, questions answered and documented. This verification process is required by EnergyStar applications in the USA, must be done by a licensed engineer. It works quite well. These audits cost the building owner an engineering fee between \$1,000 and \$2,000.                                                                                                                                                           | We suggest that the requirement of a site visit (virtual or otherwise) be eliminated for buildings under 20,000 sq meters. The other requirements should remain. |
| 3150 | Anonymous            | GE/TE               |                 | Smaller emitters cannot afford this fee. Consider that buildings emit 40% of man's carbon dioxide – and half of the floor space, and 94% of the buildings are less than 50,000 square feet. Annual energy spend is around \$2 per square foot – less than \$100,000 per year, less than 1,000 MWh. Let's say they save 10%, or 100 MWh. Renewable credits sell for about \$6.50 per MWh, so this savings in a 50,000 square foot (5000 sq meter) building would trigger a credit worth \$650 per year.                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                |
| 3150 | Anonymous            | GE/TE               |                 | So, you can see that paying \$1,000 for engineering time to support a credit worth \$650 makes no sense. And so, if ICVCM requires site visits, a market segment which emits 20% of America's CO-2 will not participate, because the travel time and cost (also using more energy) is greater than the value of the credit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                |

| 3151 | Anonymous            | TE                  |                 | This section ignores the need for companies to account for their Scope 2 and Scope 3 emissions. It is likely that public companies will be required by the SEC to reveal all Scope 2, and material Scope 3 emissions. The “ownership” of Scope 2 emissions should accrue to the entity using the energy, not the utility. Scope 3 emissions belong to the entity which supplies materials, or purchases and uses the product – and those entities treat their emissions as Scope 1 and Scope 2. But the emissions total of Scope 1, and 2 and 3 are required to be disclosed. In future years, reductions in Scope 1, 2 and 3 emissions reductions will be considered against the baseline of the same scope. | 0               |
| 3151 | Anonymous            | TE                  |                 | What will credits include? That depends on who owns the credit – reductions can be documented in only one credit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 3151 | Anonymous            | TE                  |                 | This is a different issue than the one addressed in the draft. We agree that it’s important to count emissions and their reductions only once when consolidating data. But they will appear in the disclosures of more than one emitter, as this will be required by investors and regulators.                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 3152 | Anonymous            | GE/TE               |                 | We are really confused by this concept. Regulators in America allow companies to meet their reduction targets by (for example) investing in, owning and operating wind farms and solar collectors. The regulated entity receives credits for the energy generated and retires those credits when they are used to document compliance with regulatory requirements or with voluntary commitments. This is a simple system. If credits are sold, and retired by another entity, they are objectively unavailable for the sellers to retire in support of their regulatory requirements.                                                                                                                        | 0               |
| 3152 | Anonymous            | GE/TE               |                 | The idea that some reductions will be issued a credit, and others will not is a minefield of problems. How does one account for the reductions that received no credit? You will have to ask the regulator – and their answers will not have the integrity that would be present if they were compliant with the ICVCM requirements. Why would the ICVCM include a rule that REDUCES carbon credit data integrity? It makes no sense.                                                                                                                                                                                                                                                                         | 0               |
| 3152 | Anonymous            | GE/TE               |                 | Let’s create a credit system that is used for all de-carbonization efforts. Simple, clean, efficient, with high integrity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3152 | Anonymous            | GE/TE               |                 | Table 20 is not needed. All you really need to say is that when credits are used to show compliance, they are retired. And if they are not used to show compliance, they are not retired. As was stipulated earlier, credits cannot be used twice. Simple.                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3153 | Anonymous            | GE                  |                 | We agree. But it’s important to note the following. If a utility issues a rebate for a high efficiency appliance, the deemed (estimated) savings of that appliance over its life is claimed against the objectives that regulators place on the utility. Of course, these deemed savings are speculative. They assume a lot. This has nothing to do with carbon credits. Utilities may or may not track actual results to affirm their deemed savings – and if they were wrong (on average) they may or may not alter the deemed savings used in the future.                                                                                                                                                  | 0               |
| 3153 | Anonymous            | GE                  |                 | But the owners of a laundry with 50 washers who is enjoying the savings of their investment in high efficiency washers, has reduced his energy bill, and reduced his investment with utility rebates, now owns this reduction. They apply for and receive a credit. The utility may not. Only one credit can be issued. Since this business has no ESG reporting, regulatory or voluntary goals for emissions reduction, they sell the credit.                                                                                                                                                                                                                                                                | 0               |
| 3153 | Anonymous            | GE                  |                 | And the owners place a plaque on the wall, disclosing how much they saved because of the investment they made. Some would say this owner is greenwashing, but we disagree. They are promoting their care for the environment, and the sacrifice they made to invest in de-carbonization before they invested in a second laundry up the street. They deserve the good will of the public. At the same time, the utility crows about the deemed savings they invested in, and reveals how much will be saved over the next 20 years. They too deserve praise for making investments in de-carbonization.                                                                                                       | 0               |
| 3153 | Anonymous            | GE                  |                 | There is an old saying, that success has a thousand fathers, while failure is an orphan. It is human nature to feel good about these investments, and to crow about them. The more of this there is in society, the more money will be invested to de-carbonize. It’s a good thing.                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3153 | Anonymous            | GE                  |                 | And behind the scenes, financial markets will track the savings once and once only and give credit to the entity that retired the credit. As it should be.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3153 | Anonymous            | GE                  |                 | Table 21-B is over the top in my opinion. Let’s spend our time driving results, not policing bragging rights.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |

| 3154 | Anonymous            | GE                  |                 | This comment appears. "The carbon-crediting program shall require disclosure by users of a projection of how many additional emission reduction credits they will need to achieve net-zero emissions by mid-century."                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 3154 | Anonymous            | GE                  |                 | At the bottom of this Table 5, there are options for 1 and 2. We favor 1-A and 2-B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 3155 | Anonymous            | ED/TE               |                 | Remove this requirement for additionality. The arguments for this are many, please see below. Please also see our general comments at the beginning of these comments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3155 | Anonymous            | ED/TE               |                 | 1. Integrity is the mission – the "ask" to establish additionality requires insight into the mind of the decisionmaker, whose self-interests are supported by an assertion that the project or investment would not have gone forward, without the prospect of earning carbon credits. You are begging them to lie, and some will lie, compromising the integrity of the credits.                                                                                                                                                                                                                                                                                                         | 0               |
| 3155 | Anonymous            | ED/TE               |                 | 2. If the project would not have gone forward without the credits, then it is also true that the project would not have gone forward without the other economic drivers – rebates, reduced utility expense, emissions impact on the climate, etc. The very concept of additionality, as documented in this form, is at the same time impossible to achieve, and impossible not to acknowledge.                                                                                                                                                                                                                                                                                            | 0               |
| 3155 | Anonymous            | ED/TE               |                 | 3. If folks were honest, very few if any credits would pass the additionality test. This outcome runs counter to other objectives, which require the credit program to advance the Sustainable Development Goals – which it most certainly will not if the additionality provisions are followed honestly. And if folks lie instead, it has no integrity.                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3155 | Anonymous            | ED/TE               |                 | 4. The process required involves a lot of effort and documentation, raising the overhead cost of the crediting program, thus diminishing its impact on sustainable development. If ICVCM increases administrative costs of the credit issuance system, you reduce participation, which is counter to your mission.                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 3155 | Anonymous            | ED/TE               |                 | 5. Since additionality is a judgment matter, if it is included it is likely that ICVCM will be drawn into many administrative disputes over decisions on credit issuance programs or their additionality diligence as a reason not to accredit credit issuance programs. Such discretionary authority is the tool of authoritarian governance, to enable complete discretion in decisions. This will lead to lack of public confidence in decisions made on additionality judgement calls included in the requirements. The additionality requirements will be frequently ignored by some, and enforced sparingly by others which is how rules that evaluate judgment become meaningless. | 0               |
| 3156 | Anonymous            | GE                  |                 | If legal requirements authorize the regulated entity to use credits in lieu of direct investment in carbon-reduction actions, then there should be no prohibition against issuance and retirement of these credits. In many cases, the regulated entity MUST retire credits issued to it or purchase credits and retire them to show compliance.                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3156 | Anonymous            | GE                  |                 | ICVCM should require that standards specify initial ownership of credits by the organization making the investment and that ownership of these credits can be transferred by contract. This displaces the issue of additionality.(See General issues addressed at the beginning of these comments. The ICVCM should allow the retirement of credits to show compliance with legal requirements, as is common practice in the USA.                                                                                                                                                                                                                                                         | 0               |
| 3157 | Anonymous            | ED                  |                 | This section addresses CO-2 capture and storage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3157 | Anonymous            | ED                  |                 | For clarity it would be helpful to specifically address in the opening section: programs that remove CO-2 from the atmosphere, and programs that reduce emissions relative to past practices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |

| 3157 | Anonymous            | ED                  |                 | Of course, there is no risk that the CO-2 emission reduction that happened in the past will ever reverse itself. This is the benefit of requiring that credits only be issued for historic emission reductions. It may be possible that the right to purchase credits in the future may be sold (a futures contract), but like the farmer who sells a futures contract for a quantity of corn at a defined price to be delivered in 9 months, the farmer has the obligation to deliver, either by growing the corn, or by purchasing it. CO-2 emissions reductions can be treated in the same way.                                                                               | 0               |
| 3157 | Anonymous            | ED                  |                 | Permanence risk is not an issue if credits are not issued until after the savings have happened and have been precisely measured. They are part of history, so the risk that they may not persist is not relevant to the amount of reduction documented on the credit.                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3158 | Anonymous            | GE                  |                 | Our carbon reduction credits will cover metered energy and water consumption reductions in commercial buildings. One concern we have is the shifting of energy intensive activity by outsourcing. For example, a window manufacturer that makes its own glass, chooses instead to purchase glass, shifting the energy required to a supplier – or to another plant it owns in another building. We will engage in analysis of boundaries and activity shifting as part of our evaluation and refuse to issue a credit if the reduction was done to a shift in activity outside the boundaries of the building.                                                                   | 0               |
| 3158 | Anonymous            | GE                  |                 | This seems logical and intuitive, but we want to be sure the ICVCM accreditation criteria addresses this question – to be sure the benefit of such shifts are never included in the quantification of a carbon reduction credit.                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3159 | Anonymous            | GE                  |                 | There appears to be a numbering error – 10.1.1 comes after 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3159 | Anonymous            | GE                  |                 | The intent of this section appears to address the scenario described above. Perhaps the additional verbiage to stress this point belongs here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 3160 | Anonymous            | GE                  |                 | It is important to tell your audience that credits can only be issued for reductions of emissions that have happened in the past – not the future. Clarify the last section to state that reductions anticipated in the future cannot be legitimately included in credits.                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 3161 | Anonymous            | TE                  |                 | The uncertainty in the amount of carbon which is being credited should be published as part of the credit. So, if we measure a reduction using utility grade meters whose accuracy is within 1%, and the reduction measured comports with the efficiency improvements that were implemented, then the 1% uncertainty should become part of the credit.                                                                                                                                                                                                                                                                                                                           | 0               |
| 3161 | Anonymous            | TE                  |                 | Another approach which we would support, is to require that the savings claim be reduced by the uncertainty percentage. So, in the example above, the carbon credit would be reduced by 1%. In another case, where measurement uncertainty is higher (such as 66% or 90% in the examples shown), the reduction would also be reduced accordingly to the lowest most conservative outcome.                                                                                                                                                                                                                                                                                        | 0               |
| 3161 | Anonymous            | TE                  |                 | The higher the uncertainty, the lower the value of the credit, but these two examples (one with 99% and the other with 90% uncertainty) would be able to compete fairly in a market that considers the tons of carbon on different certificates to be equal in terms of their credibility.                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 3162 | Anonymous            | GE/TE               |                 | We would think not. It would be hard to assess a credit program without involvement and intimacy with their policies and procedures. If the ICVCM wishes to assess a program, they can make the request – and if granted, proceed. But a hostile assessment, done without the support of the crediting entity being assessed, could not possibly have sufficient access to achieve a high integrity judgement.                                                                                                                                                                                                                                                                   | 0               |
| 3162 | Anonymous            | GE/TE               |                 | If, however, a credit operation is tagging credits with CCP credentials which have not been assessed or authorized, then the ICVCM should take necessary steps to correct the record, and correct the improper tagging.                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3163 | Anonymous            | TE                  |                 | Conditional approval compromises integrity. It means that the credits issued during the conditional period would not benefit from full compliance with the UCVCM standard. One can imagine that such non-compliance may arise from a trivial matter, and non-compliance for the conditional period is not material. If this is true, one must ask if the requirements that trigger the non-compliance matter at all, and if approval should be conditioned on compliance with them. One can also imagine that non-compliance is not trivial – that failure to comply compromises the integrity of the credits in a material way, which is to say, they should not be CCM tagged. | 0               |

| 3163 | Anonymous            | TE                  |                 | If conditional approval is needed, then it should be based on a particular set of less stringent requirements, and it should last for a defined period of time – 1 year perhaps – after which the full requirements would be assessed. And it should be offered to everyone, not just early adopters.                                                                                                                                                                                                                                                                                                | 0               |
| 3163 | Anonymous            | TE                  |                 | We believe that the detail and scope of the draft requirements extend far too deeply into issues that are not material to the mission, which is to drive carbon emissions down as fast as possible. These ancillary requirements are in most cases noble and good, but they are unrelated. Stipulating compliance here only slows the process, complicates the application and assessment. Far better that the ICVCM stay focused on the mission, to make emissions credits credible and valuable. Governance of other important but unrelated matters should not be included in the ICVCM standard. | 0               |
| 3163 | Anonymous            | TE                  |                 | Imagine if every standard developed and followed by companies included OSHA requirements for safety in the workplace, and every governing body added their own evaluation of workplace safety to their assessment? It doesn't make sense.                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3163 | Anonymous            | TE                  |                 | Better to stipulate that the credit issuing entity comply with all local laws and regulations, and limit your requirements to those which are most egregious – no child or slave labor, for example.                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3164 | Anonymous            | GE                  |                 | The draft is describing a change in the requirements, from initial to final. A positive assessment against the final rules will last for 5 years. But the initial approval, to less stringent requirements has no deadline – it should be one year.                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 3164 | Anonymous            | GE                  |                 | To be fair, every crediting organization in the future should be offered this one year probationary approach.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 3165 | Anonymous            | GE                  |                 | It would be unfair to suspend a crediting program without ample notice of intent, opportunity for appeal and time to cure. The intent notice should be confidential and include the reasons for the pending suspension. The UCVCVM should establish an authority to receive the company's response, meet with them, establish a reasonable time frame for resolving the problem, set deliverables and milestone dates. If milestones are not met, give them another 30 days, then suspend and make the suspension public.                                                                            | 0               |
| 3165 | Anonymous            | GE                  |                 | You need to follow your own rules regarding grievances and disputes. Making your concerns public before the company has had a chance to cure is not right.                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3166 | Anonymous            | GE                  |                 | The ICVCM should not make its intent to remove a category public until after an opportunity for appeal and ample time to cure the deficiency happens. The creation of a category involves lots of debate and diligence – the ending of a category deserves the same discretion and accommodation.                                                                                                                                                                                                                                                                                                    | 0               |
| 3168 | Anonymous            | GE/TE               |                 | These 10 Principles are comprehensive and reasonable. However, in the assessment, some of the thresholds are too stringent than the actual situation of the reduction project. Some of the assessment methods have not been established or not widely accepted, and some of the requirements are beyond the scope of responsibility of the project.                                                                                                                                                                                                                                                  | 0               |
| 3168 | Anonymous            | GE/TE               |                 | Gap between Initial threshold and Full threshold is large. It is not clear when the project should transition to the full threshold.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3168 | Anonymous            | GE/TE               |                 | Transition paths are diverse. How to make an objective judgment? There is a risk to be subjective value judgments and this principle seems to have different nature from other principle.                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3169 | Anonymous            | TE                  |                 | Tracking the flow of funds is beyond the scope of crediting-program's responsibility. It is a difficult requirement to implement. In addition, the flow of funds is a commercial confidential matter for project developers, and it is impractical for them to report to the program.                                                                                                                                                                                                                                                                                                                | 0               |
| 3169 | Anonymous            | TE                  |                 | Requirement for disclosure of information on credit revenues, recipients, allocations, etc., will disturb the vigorous trading and creation of voluntary credit.                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 3170 | Anonymous            | TE                  |                 | It is necessary to prepare a procedure to suspend the use of that methodology. However, immediate suspension and/or retroactive cancelation of the methodology may cause confusion at the carbon market and developers. Certain transition period should be allowed before its suspension/cancelation.                                                                                                                                                                                                                                                                                               | 0               |
| 3171 | Anonymous            | ED                  |                 | "Conservativeness" is often a matter of argument for its judgment. Criteria should be clearly defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 3172 | Anonymous            | TE                  |                 | If the number of VVBs eligible for CCP is small, it will take time for the validation/verification process and hamper the reduction project. Is it correct to understand that VVBs approved by the crediting-program that are considered CCP eligible VVBs?                                                                                                                                                                                                                                                                                                                                          | 0               |

| 3173 | Anonymous            | ED/TE               |                 | (Clarification) Is it correct understanding that "funding with an explicit claim to emission mitigation" does not include U.S. 45Q, and other subsidies for equipment by national governments, etc. which will not issue credits, certificate or allowance?                                                                                                                                                         | 0                                                                                                |
| 3174 | Anonymous            | GE                  |                 | (General) We understand that (a) transfer of voluntary credits and (b) creation of security interests over voluntary credits are determined by the governing law of the relevant voluntary credits (e.g., the governing law of the Registry in respect of the relevant voluntary credits). However, it is not cost-efficient for each seller/buyer of voluntary credits to examine such legal issues by themselves. | 0                                                                                                |
| 3174 | Anonymous            | GE                  |                 | Based on the above understanding, in order to expand the use of voluntary credits, it would be useful for ICVCM to recommend each operator of the Registry to provide guidance from legal perspective which describes how ownership transfer of voluntary credits is perfected, and how creation of collateral over voluntary credits is perfected.                                                                 | 0                                                                                                |
| 3175 | Anonymous            | GE                  |                 | These procedures in the Paris Agreement Article 6 transaction have not yet been finalized. It should be noted that a certain period of preparation is considered necessary                                                                                                                                                                                                                                          | 0                                                                                                |
| 3176 | Anonymous            | ED/TE               |                 | (Initial) Why is benefit sharing not a matter of commercial confidentiality? If benefit sharing is income from credits, then the specific amount and distribution of such income would be considered a matter of commercial confidential.                                                                                                                                                                           | 0                                                                                                |
| 3176 | Anonymous            | ED/TE               |                 | (Full) It is unclear why and for whom the spreadsheet is necessary?                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                |
| 3177 | Anonymous            | GE/TE               |                 | Most requirements are covered by internationally widely used guidelines such as IFC Performance Standard and Cancun Safeguard, and they are also used in actual projects. By clearly stating that these international guidelines and practices will be used, projects can be developed and implemented smoothly. Establishing new, detailed thresholds will cause confusion and disturb reduction projects.         | 0                                                                                                |
| 3178 | Anonymous            | ED                  |                 | Even in the IFC Performance Standard, the criteria for determining "Resource Efficiency" are unclear. Qualitative evaluation is realistic. It is too much to ask for all projects, including small scale projects.                                                                                                                                                                                                  | 0                                                                                                |
| 3179 | Anonymous            | GE                  |                 | Contribution to SDGs as a co-benefit is important, but it is not appropriate to make it a requirement of the reduction project, since it is a consequence and by-products.                                                                                                                                                                                                                                          | 0                                                                                                |
| 3179 | Anonymous            | GE                  |                 | There seems to be no established methodology to evaluate the net positive impact of SDGs, which is the sum of positive and negative impacts. This is an excessive requirement.                                                                                                                                                                                                                                      | 0                                                                                                |
| 3180 | Anonymous            | TE                  |                 | Credit prices cannot be determined in advance. Detailed quantitative information are commercially confidential for investment projects and disclosure is not appropriate. It would disturb business promotion. Alternative approaches should be allowed.                                                                                                                                                            | 0                                                                                                |
| 3180 | Anonymous            | TE                  |                 | Scope of benefit sharing is unclear, and if it includes secondary market, it exceeds the scope of responsibility of the project developers.                                                                                                                                                                                                                                                                         | 0                                                                                                |
| 3181 | Anonymous            | GE                  |                 | (general) It is more reasonable to ask each program to access and determine whether types of carbon credits meet the requirements of CCP.                                                                                                                                                                                                                                                                           | 0                                                                                                |

Financial Additionality is not appropriate. Please delete it. |
| 3182 | Anonymous            | ED                  |                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                |
| 3183 | Anonymous            | GE                  |                 | It is not appropriate to assume no additionality if legal regulations are adopted after the start of the project, because this would not be consistent with the reality of the project. Whether or not to invest was determined before the adoption of laws and regulations.                                                                                                                                        | 0                                                                                                |
| 3183 | Anonymous            | GE                  |                 | It is big burden for businesses to annually confirm the introduction of legal regulations after the start of the project. It is disturbance to project formation.                                                                                                                                                                                                                                                   | 0                                                                                                |
| 3183 | Anonymous            | GE                  |                 | It is understood that there are cases such as illegal logging where laws are in place but not followed, and that these cases are judged on a case-by-case basis. However, the scope of "non-enforcement is widespread" is unclear, and this description may be unnecessary.                                                                                                                                         | 0                                                                                                |
| 3184 | Anonymous            | GE/TE               |                 | Regarding mitigation measures to address the risk of permanence, classification of types by material, low, and no is reasonable. Is it correct to assume that if the required mitigation measures are taken, the three types of risk will be equivalent? It is practical to divide mitigation activities into CCS and land use change when permanence is reviewed.                                                  | 0                                                                                                |
| 3184 | Anonymous            | GE/TE               |                 | (Other Opinion.)                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                |
| 3184 | Anonymous            | GE/TE               |                 | These three classifications may affect the environmental value in the market and should be treated carefully.                                                                                                                                                                                                                                                                                                       | 0                                                                                                |

| 3184 | Anonymous            | GE/TE               |                 | It is a requirement to impose a long-term monitoring obligation on operators for 50-100 years beyond the credit issuance period. For private companies, such a long-term legal obligation is an excessive burden, and there are no credits available at this time. It is not a realistic requirement. Alternative approaches such as buffer reserve should be allowed.                                   | 0               |

| 3186 | Anonymous            | TE                  |                 | The three categories of Reduction, Nature base Removal, and Technology removal are appropriate. That is enough. Tags of contribution to SDGs and Adaptation co-benefit would be useful, but it would be burdensome to evaluate them objectively. In particular, quantified evidence for net positive contribution to SDGs is too much to ask.                                                            | 0               |

| 3188 | Anonymous            | TE                  |                 | Voluntary credits are private-sector initiative, and voluntary offsetting is an initiative that goes beyond regulation. Seeking alignment with the Paris Agreement would undermine the role and contribution of voluntary credits. It is not necessary to have the same conditions as those of the Paris Agreement, and it should be left to the choice of project developers whether to seek alignment. | 0               |

| 3195 | Anonymous            | TE                  |                 | Reconfirm the importance of commercial confidentiality for the scale up the voluntary market.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3197 | ACR ART              | ge                  |                 | Are the most important principles, criteria and requirements included in the draft CCPs and the draft Assessment Framework?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 3197 | ACR ART              | ge                  |                 | At the highest level, yes, we agree with the key principles of carbon credit integrity in the CCPs, however achieving consensus on what “integrity” means is complicated in a global carbon market across a multitude of sectors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 3197 | ACR ART              | ge                  |                 | We of course agree that offset credits should be of the highest quality, reflecting reductions, avoidance or removals that are additional to those that would occur in the absence of carbon markets (including exceeding performance benchmarks); are quantified and reported in an accurate and conservative way against a public, science-based methodology; are verified by an accredited third-party, and are generated from activities and programs that have measures in place to address risks of non-permanence and leakage. In addition, they should be associated with a credible standard-setting body that provides rigorous processes for registration, validation, monitoring, verification, methodology assessment and revision over time, and transparent tracking of the issuance and retirement of serialized credits.                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3197 | ACR ART              | ge                  |                 | Overall, we are concerned about the complexity and subjectivity of the assessment process and the prescriptive nature of the requirements. Many of the requirements in the Assessment Framework go well beyond currently accepted market norms – including the Paris Agreement itself and compliance markets such as California and ICAO’s CORSIA - without strong supporting rationale for the need for new approaches. These are detailed in our comments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 3206 | ACR ART              | ge                  |                 | With regard to double counting (criterion 4.5), the carbon-crediting program shall provide clear documentation regarding the ownership of the emission reductions achieved and shall have provisions in place to ensure that:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |

| 3206 | ACR ART              | ge                  |                 | Government funding support by itself should not eliminate the potential for a specific project type to be eligible as an offset credit. For example, Direct Air Capture projects or long-term CO2 storage projects are essential for addressing climate change and the value of a carbon credit will not typically provide sufficient incentive to enable their development – as such direct government tax incentives like that found in the U.S. or Canada will be needed in addition to carbon revenue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |

| 3206 | ACR ART              | ge                  |                 | For jurisdictional REDD+, ART has robust provisions to avoid double counting in all of its forms. However, it would not meet the current requirements vis a vis double counting with domestic compliance systems. A domestic regulated carbon market can be a powerful tool for countries to implement including allowing reduction and removal credits generated in the country through GHG projects for use to meet the compliance obligation. In some cases, these are used to meet the compliance obligation only, and no claim for offsetting or other benefits is allowed to be made. In this instance, these ERRs should be permitted to count as reductions by the national GHG program and be issued under a GHG Program. There is no double claim made or double use. The only claim is towards reducing the national GHG emissions. The compliance system is a means of valuing carbon and driving finance to those that can achieve reductions and removals immediately while longer term programs are developed and implemented. We recommend specifically permitting an exclusion from these double counting provisions for domestic compliance systems where no claims can be made. | 0               |
| 3207 | ACR ART              | ge                  |                 | The Expert Panel of the Integrity Council considered alternative approaches to assess alignment with Environmental and Social Safeguards requirements for carbon crediting programs during the initial phase. The options include:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |

| 3208 | ACR ART              | ge                  |                 | The Integrity Council seeks views from the public on this question to inform whether and how IFC risk categorization can help ensure a consistent approach by carbon crediting programs to address safeguards in the draft Assessment Framework in different jurisdictions and activity types. Your views will inform the design of the assessment process with the view to attest that mitigation activity proponents effectively implemented safeguards while providing the opportunity for current market infrastructure to update assurance systems' capacities and processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 3208 | ACR ART              | ge                  |                 | Environmental and social safeguards should be included in all crediting frameworks; however, the implementation will depend on geography and sector. As proposed by ICVCM the safeguards are excessive and impractical, too prescriptive to be broadly applied, VBBs are not currently accredited for these scopes (and it may be beyond current competencies), and thus this is an over-reach for the CCPs and AF. We suggest a more generic framework that includes assurances that applicable environmental and social safeguards have been addressed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 3208 | ACR ART              | ge                  |                 | ESG safeguards for jurisdictional REDD+ should be based on the Cancún Safeguards and their operationalization including building on current reporting to the UNFCCC. Requirements that go beyond this are inappropriate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |

There should be acknowledgement that the safeguards apply only to the mitigation activities in the locations where they occur and that cited safeguards requirements may appropriately and justifiably not be applicable to some mitigation activities and/or some projects or programs due to the circumstances of the project or program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3208 | ACR ART              | ge                  |                 | 2. Rather than ICVCM attempting to define all possible permutations and approaches that could be used and where they do and do not apply to activities, we would suggest that the ICVCM consider a simplified list of topic-based criteria which each Standard could include in the manner that best suits the nature of their programs. This provides the underlying rigor sought while providing flexibility for the differences in scale, type of activity and location of the activities occurring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3208 | ACR ART              | ge                  |                 | 3. There should be a clear link between the legal framework and requirements of the host country or jurisdiction and the safeguards requirements. Projects and programs should (as required in other CCPs) be operating legally within their location and should ensure that national, regional, and local laws and requirements are followed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3208 | ACR ART              | ge                  |                 | 4. We recommend the ICVCM consult forest countries, Standards and program developers regarding the possibility and legality of implementing many of the safeguards. For example, in Criterion 13.1.6, several indicators state that Standards must require certain activities by projects and programs "regardless of whether the Indigenous People are recognized as such..." or where Indigenous Peoples claim lands but have no recognized rights to the lands. From a practical standpoint, this would be impossible to implement as a Standard would need to among other things, define Indigenous Peoples under its program, define which should be recognized under its programs and what rights are afforded to them, and determine how land claims should be evaluated. Given the diversity of Indigenous Peoples and customary land tenure rights throughout the world, it is not appropriate for each Standard to individually provide a single definition for use across the globe. At a minimum, this will lead to large differences between Standards and significant confusion in the marketplace. | 0               |
| 3208 | ACR ART              | ge                  |                 | Similarly, the legality and ability of Standards to require and projects and programs to implement all the safeguards should be considered in consultation with a wide array of stakeholders. A Standard does not have the sovereignty to assign carbon rights or land tenure rights to any stakeholder or to force programs and projects to do things where in conflict with national or local laws.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |

| 3208 | ACR ART              | ge                  |                 | 5. The scope of these safeguards which combines aspects of multiple programs and safeguards definitions each designed for individual purposes presents will require a tremendous effort by Standards and projects and programs to implement. Small scale projects will be able to address them more quickly as many will not be applicable. However, larger projects and jurisdictional programs will require years to fully develop and implement these with a significant cost. We recommend the Expert Panel consult with Standards and program developers as to the possible implementation timeline and likelihood that programs or large projects may simply decide not to participate. It would be a travesty if the ICVCM CCPs and AF were designed in a way that only small-scale projects could meet the requirements as this would miss the opportunity for significant climate change mitigation opportunities to occur. | 0               |
| 3208 | ACR ART              | ge                  |                 | 6. There are inconsistencies in the safeguards as presented. For example, involuntary relocation simply requires consultation in 13.1.4 but requires full consent if related to Indigenous Peoples as stated in 13.1.6. Many of the criterion go in to great, prescriptive detail whereas Cancun Safeguard B which traditionally encompasses access to information, anti-corruption and other key safeguards is simply relegated to a single criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3209 | ACR ART              | ge                  |                 | Do you anticipate that there will be challenges in meeting the Sustainable Development requirements in the draft Assessment Framework under the initial threshold? If you do, could you provide information on those challenges.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 3209 | ACR ART              | ge                  |                 | We do not agree with the requirements for MRV of Sustainable Development impacts. There are many industrial project types (high GWP refrigerant destruction, methane capture) that have HUGE mitigation value, are clearly incentivized by the VCM, but do not have the same SDG impact as some other project types. We are trying to solve the climate crisis, so that should be the focus in addition to assuring no harm by projects, compliance with all national and international laws, regulations, and requirements for participatory processes. Contributions to SDGs is highly desirable, but MRV will not be simple to implement in a standardized manner across geographies and sectors.                                                                                                                                                                                                                                 | 0               |
| 3209 | ACR ART              | ge                  |                 | Detailed requirements as currently outlined in the ICVCM could result in fewer of the most socially beneficial projects being developed because the proposed significantly higher MRV cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3209 | ACR ART              | ge                  |                 | SDG monitoring should be considered as optional attributes rather than as mandatory. This will provide a pathway for inclusion and market differentiation and allow programs to implement on a timeframe that is achievable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 3210 | ACR ART              | ge                  |                 | Should mitigation activities created and managed by IPLCs be subject to differentiated safeguards requirements?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3210 | ACR ART              | ge                  |                 | Mitigation activities managed by IPLCs are often part of projects for which the IPLCs are not direct proponents (this includes projects and jurisdictional REDD programs). Therefore, differentiated safeguards would have to more broadly apply to any project that includes Indigenous Peoples and Local Communities. It would be much more pragmatic to have flexible safeguards requirements based on consultative process (as applicable) and risk mitigation than having differentiated requirements for IPLCs.                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 3211 | ACR ART              | ge                  |                 | If so, how would you recommend that the application of free, prior and informed consent (FPIC) is addressed in carbon crediting program guidance and mechanisms to ensure that relationships with IPLCs are based on informed consultation?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3211 | ACR ART              | ge                  |                 | It should be first noted that consent and consultation are not the same as indicated in this question and that FPIC is usually defined as appropriate based on the nature and impact of the activities, not based on who the project or program proponent is. We recommend FPIC rather than consultation be used when appropriate in line with best practices (as defined by UNDP and other similar organizations) across all proponents and in line with the legal framework of the country where the activity occurs.                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3212 | ACR ART              | ge                  |                 | Are there alternative approaches to additionality that should be considered and that are not covered under the current draft Assessment Framework?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |

| 3212 | ACR ART              | ge                  |                 | We do not agree with the proposed structure for assessing additionality, which would impose new requirements on crediting bodies and on project developers. It is unclear what problem these new requirements are solving, how they were developed, if/how they will add value and if they are even practical in terms of implementation and verifiability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3212 | ACR ART              | ge                  |                 | Over two decades of analysis and consideration of additionality testing has resulted in a variety of new approaches to assess additionality that are currently applied across the market. This includes performance standards that are used in combination with legal/regulatory additionality tests, such as employed by ACR (and the California Air Resources Board) as well as requirements for regulatory additionality combined with a barriers test. In our view, these do not need to be replaced, and we therefore recommend that the Expert Panel and ICVCM Board carefully analyze commonly applied approaches to additionality such as performance standards that do NOT include financial assessments or the need to demonstrate intent for carbon revenues.                                                                                                                                                                                                                                                       | 0               |
| 3212 | ACR ART              | ge                  |                 | Specifically with regard to financial additionality, the IRR test has multiple challenges including the inability to standardize an approach across sectors, geographies and financing structures; the inability to obtain benchmark IRR in certain sectors (such as forestry); the need to disclose confidential financial information on project returns and internal hurdle rates; the ability to easily game the numbers and the difficulty in verifying the results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3212 | ACR ART              | ge                  |                 | Furthermore, we disagree with the sentiment that the investment analysis must show that carbon revenues must specifically raise the financial feasibility above a yet to be defined financial benchmark. The sensitivity analysis even further complicates the approach. Such complexities require significant amounts of research and time to even determine whether a project is eligible, which ultimately could narrow participation to all but the largest carbon offset developers. The barrier analysis and market penetration analysis provide a good alternative to the financial analysis, but we disagree that the market penetration assessment must be combined with one of the other viability assessments rather than stand-alone and disagree with the subjective nature of applying "medium", "high", or "relatively low" assessment categories. Similarly, we agree that positive lists should be justified and periodically updated but disagree they must conform to the criteria for investment analysis. | 0               |
| 3212 | ACR ART              | ge                  |                 | Specifically as related to jurisdictional REDD+, the additionality test must be practical for implementation by governments, as employed by ART and as described below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 3213 | ACR ART              | ge                  |                 | The Integrity Council proposes in its draft Assessment Framework a risk-based assessment of additionality, to be conducted by the Expert Panel by project type, as a first step in the overall assessment of additionality for CCP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |

| 3213 | ACR ART              | ge                  |                 | The Assessment Framework introduces a complex two step evaluation process to determine additionality. The first step is an evaluation by the expert panel of the probability that the activity is additional. The framework states "The likelihood of additionality depends on the financial attractiveness of a mitigation activity without carbon credit revenues. An activity that financially is highly attractive is more likely to be implemented without carbon credits (except where other barriers prevent its implementation). In contrast, mitigation activities with very poor financial performance will be unlikely to be implemented without carbon credit revenues. The most commonly applied indicator for assessing the financial attractiveness of a mitigation activity is its internal rate of return (IRR) in relation to a required benchmark for investments."                                                                                                                                         | 0               |
| 3213 | ACR ART              | ge                  |                 | For jurisdictional REDD+ this type of assessment is impractical and unnecessary because it is clear that we are losing forests at an unprecedented rate and countries need financial incentives to reduce deforestation and protect and restore forests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 3213 | ACR ART              | ge                  |                 | For project-based crediting, this highly subjective exercise seems to substitute the Expert Panel's judgement for the processes within the crediting bodies to both develop appropriate additionality tests as part of the methodology process as well as to apply that test based on the technical competence of staff and oversee the independent verification of that test. How does the ICVCM intend to be an expert on all of the various types of projects in existence?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |

| 3213 | ACR ART              | ge                  |                 | We are concerned with the proposed requirement to conduct a financial attractiveness assessment on every project. In our experience, financial assessments are not always a robust approach for determining additionality, in particular when comparing the project scenario with and without carbon revenue. This is because this type of analysis is inherently subjective, due to variability in the cost of capital and pricing. The use of IRR alone is an insufficient measure of project viability since it ignores the cost of capital, which varies widely amongst project owners. For example, each company or project owner will have different access to and reliance on equity and debt, and this varies depending on the type of organization (e.g., for profit vs nonprofit). Then, different project owners will select different capital structures based on access and cost, which influences the project weighted average cost of capital (WACC), and the cost of capital will vary over time due to changes in macro and market conditions. Further, there is no consistent, industry accepted approach to underwriting investments in carbon projects with respect to future timber prices and carbon prices, but also related to other revenue streams (e.g., agricultural products, hunting and recreation leases). Deferring to the traditionally recognized financiers of timberland investments and agricultural activities, such as pension funds, would not provide the necessary benchmark information. There is no standard benchmark for land-based carbon offset investments and these would vary greatly by geography and project type (wetland restoration would be different than IFM on small private timberlands or from agricultural practices). Therefore, it would be very difficult to rely on sample data or literature, and, in our view, experts would be unable to provide a valid assessment of the indicators. Finally, because of this wide variability of financial inputs it could easily result in cases where projects that are deemed viable do not secure financing, while other projects that are deemed unviable do secure financing, somewhat weakening the use of this test to determine project additionality. | 0               |
| 3213 | ACR ART              | ge                  |                 | We also note that the subjectivity and variability of these analyses make them virtually impossible to verify with reasonable assurance, and verification bodies often lack the expertise to assess such subjective assumptions. It is equally difficult to secure qualified subcontractors to assist verifiers with this assessment, and the hired 'experts' often lack the relevant industry knowledge. Forcing verifiers to make these assessments will result in inconsistency across project verifications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3213 | ACR ART              | ge                  |                 | As a critical input to these analyses, carbon credit price and transaction costs are highly variable and subject to change over time. Carbon projects can take years to develop. The speculative nature of this attribute in the financial analysis has real world, HUGE implications as to whether a project would be considered additional and pursued. In the absence of better, more specific guidance on how this must be implemented, this requirement could adversely affect project implementation with little actual basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3213 | ACR ART              | ge                  |                 | As a specific example, forests are an asset with multiple potential revenue streams and management outcomes. IRR maximization is a motivator in considering multiple management pathways. However, it is not an exclusive motivator and amenity value is often equally or more important. IRR should be used as it is intended - as one attribute of a fuller decision framework for evaluating a management pathway. Requiring either "no income, cost savings or benefits other than carbon credit revenues" or "relatively poor financial attractiveness without carbon credit revenues" AND "carbon credits revenues significantly impact financial feasibility" AND "achievement of financial attractiveness with carbon credit revenues" sets an unrealistic bar for determining financial additionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3213 | ACR ART              | ge                  |                 | We recommend ELIMINATING the assessment in Step 1, which is subjective, questions the processes of the crediting bodies and will introduce great market uncertainty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3213 | ACR ART              | ge                  |                 | Instead of the two-phased approach, we recommend that for project level crediting the ICVCM assess whether carbon crediting programs have transparent, sectorally-appropriate, science-based additionality tests that incentivize the project action, rather than specifically or exclusively fund it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3213 | ACR ART              | ge                  |                 | For jurisdictional REDD+, we suggest performance-based additionality as defined in TREES as allowing for crediting below a conservative, historic performance level. It is important to note that regulatory additionality tests are not appropriate for jurisdictional REDD+, however, for which enforcement of laws is critical to achieving results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |

| 3213 | ACR ART              | ge                  |                 | For both projects and jurisdictional REDD+, we strongly suggest eliminating the pure financial additionality tests and the prior intent of carbon revenues and allowing for performance standards as appropriate additionality tests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 3213 | ACR ART              | ge                  |                 | b) In this assessment, the Integrity Council proposes to use as one data point analysis of carbon prices. Please provide comments as to the feasibility of use of this indicator, and on the alternative use of marginal abatement costs for this purpose.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3213 | ACR ART              | ge                  |                 | As described above, carbon prices are not an indicator of additionality and should not influence the outcome of the financial analysis component. Price reflects a host of variables including supply/demand balance, purchase size, the number of substitutes, geographic preferences, buyer brand identity, additional benefits, etc. In addition, price is commercially sensitive information that most project developers will be unwilling to divulge.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3213 | ACR ART              | ge                  |                 | c) Please provide recommendations on additional means of assessing the additionality tests carbon crediting Standards currently employ.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3213 | ACR ART              | ge                  |                 | ICVCM seems to want to substitute the Expert Panel's judgement for the crediting program's science-based peer review process. How does the ICVCM intend to be an expert on the myriad of project types in existence? This is likely an unreasonable expectation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 3213 | ACR ART              | ge                  |                 | We recommend ELIMINATING the Expert Panel additionality assessment in Step 1, which is subjective, questions the processes of the crediting bodies and will introduce great market uncertainty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3213 | ACR ART              | ge                  |                 | Instead of the two-phased approach, we recommend that for project level crediting the ICVCM assess whether carbon crediting programs have transparent, sectorally-appropriate, science-based additionality tests that incentivize the project action, rather than specifically or exclusively fund it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 3213 | ACR ART              | ge                  |                 | For all credit types, we strongly suggest eliminating the pure financial additionality tests and the prior intent of carbon revenues and allowing for performance standards as appropriate additionality tests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3213 | ACR ART              | ge                  |                 | Negative lists of activities could also streamline the process since there is likely strong industry agreement on major categories of activities that are non-additional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3213 | ACR ART              | ge                  |                 | For jurisdictional REDD+, to meet the proposed ICVCM financial additionality test, "Jurisdictional REDD+ activity proponents shall provide evidence demonstrating that expected revenues received per tonne of credited CO2-equivalent mitigation (or per tonne paid for through results-based finance) are sufficient to cover or exceed the expected costs per tonne of CO2-equivalent mitigation achieved. Expected cost per tonne shall be estimated as the ratio of: i. the jurisdictional REDD+ activity proponent's estimate of the total jurisdictional budget needed to undertake the REDD+ implementation plan amortised over the jurisdictional REDD+ activity's initial crediting period; and ii. the jurisdictional REDD+ activity proponent's estimate of the total emission reductions and removals it expects to achieve by undertaking the REDD+ implementation plan, amortised over the jurisdictional REDD+ activity's initial crediting period." | 0               |
| 3213 | ACR ART              | ge                  |                 | This type of requirement for financial additionality makes no sense at a jurisdictional scale. Drivers of deforestation and degradation always have a significant financial component. The revenue from protection and restoration activities has to be greater than the alternative land use and would need to be considered when planning the activities. Furthermore, a financial additionality test would be difficult, if not impossible, to document and verify. Acquiring the financial information from every landowner and small-scale project implementer as would be needed to perform the full analysis would be extremely burdensome.                                                                                                                                                                                                                                                                                                                   | 0               |

| #    | Comment submitted by | Para/Fig/Table/Note | Type of comment | Submitted comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Proposed change |
|------|----------------------|---------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| 3213 | ACR ART              | ge                  |                 | In addition to the above, the jurisdiction must demonstrate the implementation of new and enhanced policies and measures to meet the proposed additionality test. It is unclear in the proposed options how this will be assessed whether the new laws or the ongoing or new activities can “be reasonably expected to significantly lower emissions.” What is significant and on what basis would such an assessment take place when the activities or laws are part of a greater overall portfolio of laws and activities? Would a jurisdiction be required to make ex-ante estimates? This would not be a reasonable exercise to require, nor would it likely result in meaningful results. Jurisdictional REDD+ inherently must include and work to optimize both existing policies and new policies. A REDD+ strategy that doesn’t include both existing and new policies will be very difficult to implement, as these strategies often seek to leverage existing policies and frameworks to create benefit sharing mechanisms, expand programs within existing regulations, and improve efficiency (and in some cases, enforcement) of them. | 0               |
| 3213 | ACR ART              | ge                  |                 | We suggest that the Expert Panel consider the approach used by current jurisdictional programs as these have been vetted through expert review and many public consultations. For example, ART relies on a performance-based additionality test by only crediting for emission reductions achieved below a conservative, historical emissions baseline and for removals on land that has been degraded / deforested for at least five years. ART also requires that governments have in place REDD+ implementation plans that describe policies and measures that are contributing to reducing deforestation. These plans take years to implement and show results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3213 | ACR ART              | ge                  |                 | Also under the Assessment Framework, jurisdictional REDD+ activity proponent must also show evidence of expectation of carbon credits by providing “clearly documented evidence that the generation of carbon credits or results-based payments was considered prior to the start of the first crediting period. This may include the application or other formal documentation submitted to any jurisdictional REDD+ carbon crediting or results-based payments program, an official document shared with stakeholders with clear intent to apply to a carbon crediting or results-based payments program, or a recorded stakeholder meeting where such an application to a carbon crediting or results-based payments program was discussed.” This requirement is also not appropriate for jurisdictional REDD+.                                                                                                                                                                                                                                                                                                                                  | 0               |
| 3213 | ACR ART              | ge                  |                 | Already, the level of effort for a jurisdiction to comply with current REDD+ offset standards is significant, costly and requires extensive technical support, capacity building and importantly, political will. In addition to developing and implementing REDD+ Strategies, jurisdictions must develop and maintain MRV systems, benefit-sharing systems, and robust safeguard information systems that include public portals and significant participatory processes. Jurisdictions must also determine the legal underpinning for ownership of carbon assets, create trusts to transparently receive and disburse carbon finance and a multitude of other activities that would NOT have occurred in the absence of the carbon market.                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 3213 | ACR ART              | ge                  |                 | Jurisdictions are gaining access to carbon markets now for the first time, and many jurisdictions are in the early stages of designing their REDD+ programs in hopes of achieving results that will attract much needed carbon finance. Imposing additional barriers could devastate so much commendable action that has been taken to date and we strongly recommend that the proposed additionality requirements be removed. Instead, we suggest that the ICVCM consider the requirements of ART TREES, for example, as having been through an extensive stakeholder review and Board approval process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3213 | ACR ART              | ge                  |                 | Specifically for jurisdictional REDD+, we suggest performance-based additionality as defined in TREES as allowing for crediting below a conservative, historic performance level. It is important to note that regulatory additionality tests are not appropriate for jurisdictional REDD+, however, for which enforcement of laws is critical to achieving results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 3214 | ACR ART              | ge                  |                 | Proof that carbon credits were expected prior to project development                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |
| 3214 | ACR ART              | ge                  |                 | Criterion 8.5, as noted by ICVCM, goes beyond the project start date requirements established by crediting bodies. The existing lookback limitations and deadlines for validation/registration of a project following the start date serves to screen out pre-existing projects while allowing project developers some flexibility in navigating robust reporting and documentation rules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |

| 3214 | ACR ART              | ge                  |                 | An additional requirement to provide evidence that carbon credits were explicitly considered prior to the project start date will add an undue administrative burden to project developers and will needlessly exclude some high-quality projects from CCP eligibility. We strongly recommend the removal of criterion 8.5 from the assessment of additionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3215 | ACR ART              | ge                  |                 | The Integrity Council is open to views on the appropriate balance of requirements between the criteria applied to assess permanence, as well as alternative approaches. Are there alternative approaches to permanence that should be considered and that are not covered under the draft Assessment Framework?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0               |
| 3215 | ACR ART              | ge                  |                 | The first two proposed options in the Assessment Framework for assuring permanence require either 1) a 50- year project monitoring and reversal compensation term, or 2) a 25 year legally binding minimum MRV term with discounted ton-year crediting (e.g., 25% credits per year). The 100 years as “permanent” is proposed based on the 100-year GWP’s, which have no scientific basis in relation to the permanence of carbon emissions reductions or removals in the atmosphere.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 3215 | ACR ART              | ge                  |                 | The vast majority of forestry credits being issued by independent standards today (likely less than 3%) do not meet these requirements, nor are they reasonable if the objective is maximum program uptake and climate impact in the near term. It is questionable whether a 100- year commitment by any organization is even credible given the relatively short institutional life of companies. Furthermore, we advocate that the CCPs explicitly prohibit or propose extreme limitations on ton year accounting (as in option 2) due to the lack of scientific consensus on that approach, and the vast difference in crediting that result from different approaches that have been proposed and applied by Standards.                                                                                                                                                                                                                                         | 0               |
| 3215 | ACR ART              | ge                  |                 | Option 3 should be deemed as equally viable as other options and defined as multi-decadal commitments for projects with enforcement for MRV during that period, a robust reversal risk mechanisms including a buffer pool and no buffer pool refunds. The mechanism should ensure reporting and compensating in real time (during the verification cycle).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3215 | ACR ART              | ge                  |                 | For JREDD, option 3 should be defined as enforcement for MRV and compensation for reversals in real time (during the verification cycle) and retirement of cumulative buffer pool contributions when the Participant leaves the program to compensate for future potential reversals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0               |
| 3215 | ACR ART              | ge                  |                 | While being implemented by some project-level crediting programs, differentiation between intentional and unintentional reversals is not appropriate for jurisdictional REDD+. To date, no program has an insured buffer pool and only a few have enforceable legally-binding agreements for long-term MRV.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 3215 | ACR ART              | ge                  |                 | In cases in which reversal reporting and compensation is required immediately, and in which the buffer pool is robust (no refunding of credits), the buffer pool may be able to adequately compensate for future reversals many decades past the end of MRV.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 3215 | ACR ART              | ge                  |                 | It is important to note that reversal risk is inherently different for activities that are being implemented at a scale (i.e., national or subnational) with appropriate risk mitigation measures in place including contributing to a buffer pool and monitoring, reporting and compensating for reversals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 3215 | ACR ART              | ge                  |                 | For jurisdictional REDD+ a reversal occurs when reported annual emissions are above the conservative, historical crediting level of emissions from deforestation and forest degradation. These are actual ER that have been verified to have occurred. Unlike at the project scale, a single fire or harvest event does not necessarily cause a reversal in a jurisdictional REDD+ program since forest carbon stock reversals in one area may be absorbed or netted out through performance reducing emissions and enhancing stocks in other areas. There is no differentiation between intentional and unintentional reversals because these jurisdictional reversal results from a combination of natural and anthropogenic causes (related to, but not limited to timber harvesting, agricultural expansion, community dependence on forest products, supply chains, overall economic health, strength of land and forest management policy, governance, etc.). | 0               |

| 3215 | ACR ART              | ge                  |                 | Jurisdictional-level implementation can ensure more robust accounting for reversals since at a large scale, forest carbon stock reversals in one area may be absorbed or netted out through exceptional performance in other areas. Unlike at the project scale, a single fire or harvest event does not necessarily cause a reversal in a jurisdictional REDD+ program. Therefore, at minimum, jurisdictional approaches to implementation should be recognized for reducing risk or reversals, effectively downgrading where nature-based activities sit on the “susceptibility of reversal” matrix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3215 | ACR ART              | ge                  |                 | ART’s standard TREES has requirements in place to contribute to the buffer pool as well as monitor, report and compensate for reversals. Buffer pool contributions are not refunded over time. The TREES buffer pool contributions (25% of credits per issuance, which can potentially be reduced to 5% if a jurisdiction achieves all three mitigating factors, but most likely at the higher end) are significant when compared with the annual percent of forest loss across large areas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |
| 3215 | ACR ART              | ge                  |                 | According to data from Global Forests Watch, while cumulative forest loss can occur in jurisdictions that are not effectively implementing or being rewarded for reducing emissions from deforestation, the loss occurs slowly over time - having trended under 1% annually for the past 15 years, and interannual differences are relatively low even during changes in governments. This analysis suggests it is unlikely that a Participant would have a reversal for an amount that exceeds its cumulative buffer contribution. Given the trends in annual forest loss of under 1%, the Participant’s comparatively sizeable buffer pool contribution should conservatively compensate for any prospective reversals for many decades into the future.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |

| 3215 | ACR ART              | ge                  |                 | Under TREES, in the event of a reversal, the Participant reports the total volume (of annual reported emissions higher than the conservative historic crediting level). The ART Secretariat retires the corresponding volume of units from the buffer pool. If the reversal volume exceeds the Participant’s total contributions to the buffer pool to date, the Participant must replenish the difference. If the Participant does not have units available to compensate for any amount that the reversal exceeds buffer pool volume contributed to date (from any credits issued that have not been transferred or retired), that amount would be compensated by other credits from the pool. The Participant would then be required to replenish that volume from a future issuance. This may carry forward to multiple future issuances or across crediting periods as needed to ensure the full amount is replenished. In addition, after a reversal, a Participants must increase its buffer contribution for a period of five calendar years by 5% to reflect increased reversal risk. The five calendar years carries forward across crediting periods as well. This requirement is enforced through the legal Terms of Use Agreement. | 0               |
| 3215 | ACR ART              | ge                  |                 | If a Participant were to leave the ART program prior to the successful replenishment of the buffer pool, they would be required to purchase credits to make the buffer pool whole as per the legally binding Terms of Use Agreement they signed when they joined ART.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0               |
| 3215 | ACR ART              | ge                  |                 | When any Participant leaves the ART program, any remaining buffer pool credits they have contributed are automatically retired. This is to compensate for any future reversals that may occur. In addition, buffer pool credits are never returned to a Participant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3216 | ACR ART              | ge                  |                 | Should the Integrity Council consider the establishment of an attribute to differentiate credits according to the type of underlying mitigation activity? If so, at what level should types be differentiated (e.g., reductions vs removals, tech-based vs nature-based)?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0               |
| 3216 | ACR ART              | ge                  |                 | We believe labeling projects by generic categories will be useful for buyers. However, too many labels will create confusion. ACR and ART currently have registry functionality in place to label credits as either verified emission reductions or removals (not further differentiated by tech or nature since that is obvious under the project type), for credits that have a host country authorization (and ultimately a corresponding adjustment) and for credits that are ICAO qualified. We support labels for projects that have additional certifications such as for the SDGs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |

Risk categorisation: Since not every activity is likely to carry the same risk of doing harm, it makes sense to differentiate the levels of safeguard requirements dependent on the likely risk level. This is done through the environmental and social screening , and a very common way to differentiate is a scale from 'Category A to C' or 'High, Substantial, Medium and Low'. Risk categorization not only determines the relative risk of the project, but most importantly, it determines the level of social and environmental assessments required for addressing and managing the project's potential social and environmental adverse risks and impacts.                                                                                                                                                                                                                                                      | 0               |

Environmental and social assessments: Social and environmental assessment are generic terms used to describe a process of identifying, predicting, and evaluating, negative and positive social and environmental impacts of projects. Identification of a project's potential risks and impacts in advance allows for informed decision making to avoid and reduce adverse consequences and maximize potential project benefits. It may range from relatively straightforward analysis and application of well-understood standard good practice (Such as Good International Industry Practice, or GIIP, which is defined as the exercise of professional skill, diligence, prudence, and foresight that would reasonably be expected from skilled and experienced professionals engaged in the same type of undertaking under the same or similar circumstances globally or regionally. The outcome of applying good international practice should be that the project employs the most appropriate approaches and technologies in the project-specific circumstances. World Bank, Environmental and Social Framework, ESS1, p. 31, ft. nt. 23.) for projects with moderate potential impacts to full Environmental and Social Impact Assessments (ESIA) (with special thematic studies) for higher risk projects. Notably that development and financial institutions approach environmental and social assessments in a manner that allows for the identification, assessment and management of potential negative and positive risks and impacts of a project. | 0               |
| 3218 | Anonymous            | 0                   |                 | 5. Management or action plans: In order to address negative effects an activity may have; appropriate risk avoidance, reduction and management measures. These are key tools that need to be developed and implemented, following a clear mitigation hierarchy (Apply the "mitigation hierarchy" that prioritizes (i) avoidance of potential adverse impacts, and where avoidance is not possible, then (ii) minimization and reduction; where adverse residual impacts remain, then (iii) mitigation measures need to be applied, and, as a last resort, (iv) measures to offset impacts that cannot be appropriately mitigated.). Management plans may range from targeted measures, appropriately scoped management plans (e.g. scaled Environmental Social Management Plan-ESMP) to comprehensive management plans (e.g. full ESMP). And where relevant, issue-specific plans, (e.g. Resettlement Action Plan, Indigenous Peoples Plan, Biodiversity Action Plan, Cultural Heritage Management Plan).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3218 | Anonymous            | 0                   |                 | 6. Stakeholder consultations: Consulting with potentially project affected stakeholders is an extremely important tool for ensuring that an activity does not affect them negatively. In their most basic form, stakeholder consultations will consist of informing local communities of plans for an activity; however, an exchange of information and their participation in the identification of potential risks is commonly accepted as superior.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3218 | Anonymous            | 0                   |                 | 7. Grievance and redress mechanisms (GRMs): GRMs are generally designed to receive and facilitate resolution of concerns and grievances about a project's environmental and social performance, through mediation or specific recommendations. These mechanisms seek to resolve concerns promptly, using an understandable and transparent consultative process that is culturally appropriate, readily accessible, at no cost, and without retribution to the party that originated the issue or concern.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 3218 | Anonymous            | 0                   |                 | 8. Monitoring and reporting: An important aspect of safeguarding against negative impacts is to monitor the effects of an activity on the local communities and environment over time. Therefore, monitoring systems are an indispensable tool to ensure continued compliance of an activity with defined safeguard principles. Independent and frequent reporting of results can strengthen accountability and credibility of the monitoring process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0               |
| 3218 | Anonymous            | 0                   |                 | 9. Transparency requirements: As part of stakeholder consultation requirements, management plans and monitoring and verification processes, it is a good practice to publish project documentation, impact assessments and monitoring reports. Another transparency criterion may include the publication of project plans and reports in local languages, and in a form that is accessible and understandable by local stakeholders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 3218 | Anonymous            | 0                   |                 | 10. Project exclusion lists: A number of project types may a priori be excluded from funding. This may include projects that are in conflict with international regulations, specific project types that are known to have a particularly high risk, or activities that are at odds with basic principles a financing institution may have adopted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0               |

| 3218 | Anonymous            | 0                   |                 | Unfortunately, the public consultation of the CCPs and draft assessment framework has not offered any analysis and/or background studies to justify the rationale for the thresholds being set. The Integrity Council does not identify with any specificity the challenges currently being faced in the carbon market and how the proposed CCPs and Assessment Framework solve them and integrate the key project risk management tools and best practices outlined above. Table 1 offers an overview of the limitations of these standards and our recommendations for the Integrity Council. This is in alignment with our general recommendation above, whereby by adopting a one of the best-in-class international environmental and social standards frameworks would address these limitations. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3219 | Anonymous            | 0                   |                 | Limitations of project level standards and recommendations for the IC-VCM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | As noted in general recommendation offered for Section 7 of draft assessment framework, we recommend the adoption of one of the best-in-class international environmental and social standards frameworks, which will address the shortcomings of the certification standards' safeguards criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

As per best-in-class standards, the types and breadth of social and environmental assessments, and methods used will need to be determined and be commensurate with the type, scale, location and significance of impacts posed by the project. It may range from relatively straightforward analysis and application of well-understood standard good practice (Such as Good International Industry Practice, or GIIP, which is defined as the exercise of professional skill, diligence, prudence, and foresight that would reasonably be expected from skilled and experienced professionals engaged in the same type of undertaking under the same or similar circumstances globally or regionally. The outcome of applying good international practice should be that the project employs the most appropriate approaches and technologies in the project-specific circumstances. World Bank, Environmental and Social Framework, ESS1, p. 31, ft. nt. 23.) for projects with moderate potential impacts to full Environmental and Social Impact Assessments (ESIA) (with special thematic studies) for higher risk projects. |

Management plans should be developed and implemented, following the mitigation hierarchy (Apply the "mitigation hierarchy" that prioritizes (i) avoidance of potential adverse impacts, and where avoidance is not possible, then (ii) minimization and reduction; where adverse residual impacts remain, then (iii) mitigation measures need to be applied, and, as a last resort, (iv) measures to offset impacts that cannot be appropriately mitigated.), including:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 3225 | Anonymous            | 0                   |                 | Certification standards generally carry out verifications every 5 years (CCB section 1.5: "at least every 5 years") and during this time a lot could happen/change during the implementation of the projects with regards to social and environmental risks and impacts.                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3226 | Anonymous            | 0                   |                 | Limitations of project level standards and recommendations for the IC-VCM                                                                                                                                                                                                                                         | As noted in general recommendation offered for Section 7 of draft assessment framework, we recommend that carbon programs and standards adopt/apply the requirements, guidance and procedures of best-in-class standards. This extends to transparency and disclosure of information concerning risks, impacts and management measures of a project, which must be disclosed in a timely manner, in an accessible place, and in an appropriate form and language to help affected communities and other stakeholders to understand the opportunities, risks and potential impacts of project activities. Access to project information is a prerequisite for effective stakeholder engagement.                                                           |

| 3228 | Anonymous            | 0                   |                 | • Does not have a robust procedure and guidance for environmental and social risk assessments in alignment with good international industry practice on ESS. In comparison, international standards have dedicated performance standards, with procedures and guidance on assessing and managing risks of displacement and resettlement. Without adequate procedures and guidance the identification and assessment of these potential risks and impacts would be likely limited and/or inadequate. | 0                                                                                            |

Recognizing that the methodologies to validate the stringency of NDCs and LTSs are still evolving, the XXX proposes a phased approach to demonstrate the environmental integrity - where feasible to establish the stringency of the climate plans, it is sufficient to perform the corresponding adjustments to demonstrate the integrity; where not feasible, the same can be achieved through both stringent or conservative baselines and corresponding adjustments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3233 | Anonymous            | T                   |                 | As carbon markets under the Paris Agreement operate under the countries' NDC context, the requirements to demonstrate the unit quality need innovative approaches that address uncertainties of the methodologies used under the CDM, facilitate faster and more inclusive market access, and ensure the credibility of markets. As markets under the Paris Agreement are expected to support increasing the ambition of countries' climate action, approaches should take NDCs, long-term strategies (LTSs), and their baselines into consideration.                                                                                                                                                                         | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 3234 | Anonymous            | T                   |                 | In relation to the comment provided in #1, having a separate requirement that the mitigation activity uses a technology or practice that is transformational and consistent with a net-zero emissions goal by mid-century is not supportive of the way countries increase their ambitions through carbon markets under the Paris Agreement.                                                                                                                                                                                                                                                                                                                                                                                   | Countries have different mitigation options that have different cost, and implementing every mitigation option counts in achieving the country's NDC and beyond (LTS). Moreover, majority of countries have not yet set up their targets/goals consistent with a net zero emissions goal under an LTS. In that sense, approaches that rely on stringency of NDCs and how the targets are set under NDCs are more desirable and effective in catalyzing climate actions and investments and ensuring integrity of the overall carbon markets. Detailed requirements of the eligible mitigation activity laid out in the draft CCP only put excessive policing, which may dampen the market unnecessarily. It is important that new systems and approaches support increasing the transparency to create value first and facilitate learning by doing. Information such as the type of mitigation, technology, practice, and sectors of the underlying mitigation activity, however, is what buyers would be interested in and have different preferences for. Therefore, it is important to transparently disclose such information, and, for example, the Climate Warehouse data taxonomy is designed to support that. |
| 3235 | Anonymous            | T                   |                 | Regarding the requirements on the degree of reversal risk, it is assumed that any mitigation activity related to the management of carbon stocks has a material risk of reversals, and that projects that would lead to a lower demand of fossil fuel have a zero risk. However, as experience shows with recent trends, the fossil fuels that were saved and left in the ground, could be extracted again in the future if economic conditions are adequate for it (e.g., electricity prices), reverting the mitigation process. This is not different from a jurisdictional REDD+ program where the carbon saved could be released in the future if economic conditions make this to be favorable (e.g., commodity prices). | Therefore, we would suggest revisiting the concept of non-permanence and looking at this with a different perspective.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 3235 | Anonymous            | T                   |                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The assessment framework provides two recommended approaches for addressing non-permanence risk, which are prescriptive, not backed by science, and limit the possibility of using other approaches and options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3236 | Anonymous            | G                   |                 | On the requirements on monitoring and compensation for reversals approaches, requirements are applicable to any kind of intervention regardless of the inherent risk of the intervention, which is incorrect. A large-scale jurisdictional program or a national policy to increase use of wood harvested products might not have the risks that exist in a small-scale Afforestation/Reforestation project, but all these are conflated. Moreover, the commitment to monitor and compensate reversals for more than 50-100 years would not justify the actual risk of reversals and would be extremely costly, making unfeasible for projects to generate emission reduction credits                                         | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 3237 | Anonymous            | T                   |                 | On the use of temporary crediting, this approach was proposed under the CDM, but it was demonstrated that there are more pragmatic approaches, and that this represents a very significant barrier for scaling up of markets as these temporary units would not be fungible with other units.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                                                                                                                                                          |
| 3238 | Anonymous            | G                   |                 | In terms of quantification, there is a problematic requirement from the assessment framework that overlays the use of conservative methods over accurate and most precise approaches, which undermines the efforts of programs and projects to make progress towards improving MRV methods                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Therefore, care should be taken when relating conservativeness versus accuracy to ensure that programs and projects use the best available methods and approaches.                                                                                                                                                                                                                                         |
| 3239 | Anonymous            | G                   |                 | The balance needs to be maintained between the requirements for standards to ensure net positive SD impacts and for ensuring robust environmental and social safeguards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | While ensuring net positive SD impact is desirable, having it as an additional attribute like the way the draft suggests (in #12.2 quantified SDG impacts) may be sufficient.                                                                                                                                                                                                                              |
| 3240 | Anonymous            | T                   |                 | in terms of rules for accounting carbon credits inside REDD+ jurisdictional programs, it is important to clarify that the rules for nesting are often defined by sovereign governments, and projects and programs need to comply with them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | rather than requiring having specific procedures in place for aligning baselines at the standard level, the standards should look at how projects/programs are aware of their responsibilities to comply with the local legislation, and such compliance should be validated and verified by third-party entities, which is currently the normal approach under most internationally recognized standards. |
| 3241 | Anonymous            | 0                   |                 | <p>Open Letter as part of ICVCM Consultation</p> <p>The purpose of this letter is to encourage the ICVCM to continue the good work to fulfil its purpose to “ensure the voluntary carbon market accelerates a just transition to 1.5C”. Embedded in this purpose is the imperative to fundamentally change the economics on the ground in rainforest nations such that rainforests are worth more standing than felled. There are no reasonable scenarios of a sustainable world without these standing forests being saved. The work is necessarily complex, but as is stated on the homepage, the theory of change is deceptively simple: “build integrity and scale will follow”.</p> <p>Continued Gratitude, Hope and Concern for the work of ICVCM</p> <p>Just over a year has passed since the public consultation phase for TSVC; and again would like to express my ongoing gratitude for the dedication and hard work of those working at the center of this process under the leadership of the team and the Board. There has clearly been an effort to include diverse viewpoints. I was particularly impressed when Mr. McDonnell attended a recent dinner of rainforest nations to personally solicit opinions directly from the countries on the supply side of the forest debate. I do hope that efforts like the event I witnessed yield results that move us to a unified way forward. As before, I remain concerned that the nature of the BSI-administered process sets up well-trained, well-resourced, persistent, vocal entities for success; while discouraging many others whose voices we all say need to be heard.</p> <p>Key points that do not fit in a line-by-line review of the BSI process:</p> <p>1 We can't build integrity if we don't anchor to the Paris Agreement</p> <p>The world needs one set of emissions and one set of accounts. VCMs should not be able to play outside the UNFCCC and one coherent global carbon budget. Set up within the PA is a method for host countries to account for all that is happening in their jurisdiction, from forest preservation to logging and more. Buyer countries can buy credits through Corresponding Adjustments and one ton is accounted for, with integrity, across the system. While it is admirable to see full alignment with NDCs as part of the Assessment Framework there is currently no requirement to register CAs. If we allow parallel systems and do not require CAs, we leave open double-counting at a truly massive scale. Host countries must adjust their NDC when a credit is used as an offset, irrespective of the buying entity being public or private sector: ensuring an exclusive claim on a ton of CO2 and</p> | 0                                                                                                                                                                                                                                                                                                                                                                                                          |

| 3241 | Anonymous            | 0                   |                 | <p>THE CARBON CREDITS CONUNDRUM: WHY GOVERNMENTS NEED TO REGULATE CARBON REMOVAL AND VOLUNTARY MARKETS GUIDANCE DOCUMENT FOR POLICY MAKERS (AUGUST 2022)</p> <p>A N N E X : WHY (AND HOW T O) COUNT CARBON (AND O THER GHGS)?</p> <p>Global warming, and the catastrophic climatic change it brings, is affected by the total, physical quantity of greenhouse gases (GHGs) emitted to and removed from the atmosphere, regardless of where, how, or why those emissions and removals occur. Accurately measuring physical stocks and flows of greenhouse gases for both natural and human-led processes is necessary to understand how these activities result in changes in atmospheric greenhouse gas concentrations and thereby understand the work needs to be done to stop them from increasing further.</p> <p>Such measurement of physical GHG stocks and flows is a fundamental component of carbon accounting. However, the primary purpose of carbon (or GHG) accounting not to quantify physical greenhouse gases, but to quantify responsibility for emissions and the actions taken to reduce them. Such ownership of GHG emitting and reducing activities is used to incentivise activities that decrease emissions and increase removals and penalise activities that increase emissions or decrease removals. The purpose of carbon accounting is accountability.</p> | 0                                                                                                                                                       |
| 3241 | Anonymous            | GE                  |                 | Our response to the first bullet question is negative. The IC-VCM under its current stated mandate to be the independent governance body for the voluntary carbon market places an onus on it not to rely on industry bodies to determine assessments. Industry bodies can provide valuable input but those should be balanced with wider sectorial and societal considerations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | No. It is important that the Integrity Council not wholly rely on assessments by the Technical Advisory Body under CORSIA or any other comparable body. |
| 3241 | Anonymous            | GE/TE               |                 | Yes. However, the AF could possibly be even more explicit when it comes to assure that carbon credits issued in the VCM live up to the standards of environmental integrity. Also, we think that it is critical that a CA is carried out in order to be able to make claims around actual emission reductions. If no CA is carried out, the actions are purely goodwill – which of course also is important – but are not possible to relate to corporate reporting around emissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                       |

| 3241 | Anonymous            | Ge                  |                 | Refer to cover statement. In addition, Gold Standard supports the exclusion of project REDD+ as unsuitable for the stated use case of offsetting. We note that many of the issues associated with project REDD+ are also present in jurisdictional REDD+.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                       |
| 3241 | Anonymous            | Ge                  |                 | While having a functioning voluntary carbon market is essential to providing the necessary incentives for decarbonization, the current market has only managed to scale to 1bn USD and faced severe challenges regarding the impact of most of the credits generated in the several years it has been in existence. In that regard, the work undertaken by the Integrity Council is extremely important, but the rethinking should be foundational and not anchored by the current market structure or industry participants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                       |
| 3241 | Anonymous            | Ge                  |                 | Two central criteria need to be met to for the carbon market to scale and achieve its purpose, in our view:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0                                                                                                                                                       |
| 3241 | Anonymous            | Ge                  |                 | 1. By virtue of it being a voluntary market, stakeholders in this space so far are only participating to protect their reputation, and so integrity through all angles need to be ensured through mechanisms that provide the correct safeguards to avoid participation turning from reputational risk mitigation to reputational risk increase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                       |
| 3241 | Anonymous            | Ge                  |                 | 2. For the carbon market to function, the financial incentives for the ‘issuers’ of carbon need to make sense. The distribution across the value chain needs to be more equitable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0                                                                                                                                                       |
| 3241 | Anonymous            | Ge                  |                 | We believe that rather than merely adding safeguards to current offsets, a radical rethink of these markets is warranted. We are not framing our thinking across vectors of performance, additionality, permanence and co-benefits although these aspects are intrinsically embedded in various elements of our response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                       |

| 3241 | Anonymous            | Ge                  |                 | Regardless of whether jurisdictional carbon credits (those issued directly by relevant states/countries) scale or not, we believe that the nesting of existing projects within relevant jurisdictions can provide safeguards against carbon leakage. Proposals to ban or bans of development or sales of offsets abroad by various countries would help begin rationalizing the space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |
| 3241 | Anonymous            | Ge                  |                 | Fortunately we are at the juncture of many important developments that can provide the appropriate backdrop for the market to flourish. We believe the premise of Paris Articles 5 and 6 represent an ideal setting under which the voluntary carbon market can see the necessary reset it needs to be able to scale and have the intended mitigation impacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3241 | Anonymous            | Ge                  |                 | This is not to say that private developers should not be able to participate in carbon generation. However, this needs to be with the understanding that every project is preliminarily approved by the relevant government, through a royalty or similar type of scheme. This would have multiple benefits including:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |

This ultimately allows for carbon to be treated like a resource much like other commodities (for example, oil reserves tend to be owned by governmental actors with operating licenses granted to various private sector participants).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3241 | Anonymous            | Ge                  |                 | 2. One of the current shortfalls of the market—especially for carbon credits generated in emerging markets—is that extremely high Internal Rates of Return are disproportionately being taken advantage of by developers from developed countries. Having a royalty type scheme would allow for more equitable distribution of financial windfalls to the local stakeholders, which would not only help optimize social cobenefits, but also result in greater buy-in from the local communities and avoid accusations of profiteering from unscrupulous parties.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 3241 | Anonymous            | Ge                  |                 | 3. Such a scheme would provide incentives for the relevant countries to strengthen their regulatory frameworks to enable broad-ranging mitigation outcomes, be it through incentivizing industrial decarbonization (through cap-and-trade systems, for example) or through natural capital conservation efforts. Acknowledging that up until now, especially for the latter, the incentives were misaligned in that countries could only directly monetize encroachment on natural capital and have not been rewarded for providing carbon capture for the rest of the world. 4. Conservation of existing ecosystems needs to be a central part of the carbon market. Native tropical reforestation is difficult. It requires years of nannying, careful management plans and intense field work. Financially, it's incredibly difficult to make it work and it can take more than a decade to break even. Reforestation is not impossible, but it is much easier to prevent the loss in the first place amid the right incentives. | 0               |
| 3241 | Anonymous            | Ge                  |                 | The timing for this is especially opportune, as most emerging countries have had cheap access to capital over the past decade and have been able to grow through debt and leverage. However, this era is now coming to an end, with rising interest rates and inflation. This will incentivize these countries to further deplete their natural resources to meet their fiscal and budgetary requirements, which could cause further encroachment on natural capital unless the correct set of incentives is put in place. Having those incentives put in place through credible carbon markets would be a step in the right direction.                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 3241 | Anonymous            | Ge                  |                 | This rethinking of carbon markets also comes at a time where the IMF is discussing Special Drawing Rights (SDR) redistribution on the basis of sustainable criteria. Additional sources of revenue for certain countries through carbon markets could provide for one of the only frameworks whereby those SDR reallocations would be justified from a financial perspective ,with improved fundamentals for the countries resulting from the windfall of carbon credit sales.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |

|------|----------------------|---------------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| 3241 | Anonymous            | Ge                  |                 | As a consequence, the baseline assumptions for carbon mitigation should be reassessed, in our opinion. For example, the Gabon expected carbon credit sale would not generate a meaningful amount of credits under many of the existing registries. It is counterintuitive that the country should be penalized for having made extensive conservation efforts in the past. A natural pushback would be to say that existing conservation regulation reduces the additionality value of potential offsets produced by this sale, but pressures to change said regulation are high in places for which social advancement still has a long journey ahead. c 10 mn credits a year for a country like Gabon at 25-30 USD per ton represents an incremental 3% contribution to GDP, which is not insignificant. If one assumes a steady increase in the price of these offsets, this number could increase. | 0               |
| 3241 | Anonymous            | Ge                  |                 | Another example that might help illustrate the issues at stake here is the situation regarding drilling rights in the Virunga basin in the DRC. Without engaging and involving the governments in some sort of risk sharing scheme (which can be scaled to all DRC's natural capital) and assuming that crypto groups end up with the right to generate carbon credits, we could see the generation of impactless carbon credits with zero integrity. Instead, we believe that various stakeholders could/should be working with the country to buy sovereign carbon, which will then be allocated to that exploration block.                                                                                                                                                                                                                                                                          | 0               |
| 3241 | Anonymous            | Ge                  |                 | Another pushback would be to assume that the market could not absorb a potential flood of carbon issuance, particularly from entities that have not historically contributed to climate change in a meaningful way. We would challenge this view, as we believe a market that resonates much more directly from an integrity perspective with corporates and other purchasing entities will result over time in much stronger demand and scale.                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 0               |
| 3241 | Anonymous            | Ge                  |                 | Finally, we believe certain risks should be addressed in the market. To provide the backdrop for this market to scale up credibly, we believe that various safeguards should be put in place with regards to:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3241 | Anonymous            | Ge                  |                 | 1. Baselines and performance measurements need to be credible at country level. Various third-party, newly created rating agencies tools for assessing the magnitude of carbon sinks for nature-based carbon capital but complementary verification frameworks could help assess overall carbon emissions/sinks potential at a country level. Using the UNFCCC REDD+ as a starting point and enhancing methodologies with respect to baseline calculations to counter some of the common criticism of these schemes may be warranted.                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 3241 | Anonymous            | Ge                  |                 | 2. Nationally Determined Contributions (NDC)-based baselines should be ambitious, and NDCs need to continue to be improved at an appropriate pace to align the world with a 1.5-degrees Celsius warming scenario. If this is not done, countries could be incentivized to be water down NDC ambitions to generate excess credits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3241 | Anonymous            | Ge                  |                 | 3. For nature-based offsets, more emphasis should be put on rich biomes vs monocultures which have higher permanence related risks and arguably less additionality since most of those are financially relevant without the adjacent credit issuance. For example, the Guanare (verra verified) project, which consists of planting short-rotation, non-native Eucalyptus trees for pulp and receiving removal credits has questionable additionality. There are similar plantations all over the surrounding landscapes, which suggests that planting these trees was not a financial hurdle, and may have always happened. These credits sell for less than \$10/tonne, which is not even one tenth of the money made from the timber and less than one third of the cost to plant the trees.                                                                                                        | 0               |
| 3241 | Anonymous            | Ge                  |                 | We welcome the Integrity Council's efforts to provide credible, rigorous and readily accessible means of identifying high-quality carbon credits that create real, additional and verifiable climate impact with high environmental and social integrity. We sincerely appreciate the opportunity to provide our recommendations and your consideration of our perspective.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |

| 3241 | Anonymous            | 0                   |                 | <p>XXXX applauds the CCP initiative. We believe that robust integrity and quality principles for the Voluntary Carbon Market (VCM) are essential for genuine climate mitigation and, from our perspective, volume deployment of removals with geological storage.</p> <p>Over the last five years, XXXXX has been preparing to launch the largest carbon capture plant for removals in the EU, capable of sustainably capturing and removing 800 000 tonnes of biogenic CO<sub>2</sub> per year, based on an already existing CHP plant in Stockholm. With funding being secured in 2023, our project will launch in 2026 with the ambition to make a substantial contribution to the very demanding need for CDR as deemed necessary by IPCC AR6 to stay within a global warming of 1.5 °C.</p> <p>Our initiative is relying on securing multiple revenue streams where government and institutional aid can be combined with global revenues from the VCM. This innovative model, where we envisage to leverage public-private partnerships to secure the necessary funds, is critically dependent on that the regulatory framework acknowledges and promotes voluntary funding in parallel to the other funding streams for as long as the removals remain outside a compliance regime.</p> <p>Against that background, XXXX is deeply engaged in many of the currently on-going international work streams to develop a robust, high-integrity rule book for the VCM. In this document, we submit our comments for each of the Core Carbon Principles, in addition to a few introductory, general comments.</p> | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 3241 | Anonymous            | 0                   |                 | Comments - It is not clear if the principles will relate to all types of carbon credits or only those deemed to be ‘offsets’. In CCCC meeting we asked if ‘Insets’ would be included and we understand this is undecided. In another document Part 5 – offsets are defined – Insets are not. The definition of Offsets makes a distinction about value chains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3241 | Anonymous            | Ge                  |                 | <p>XXXXX (‘the Bank’) supports the Integrity Council for the Voluntary Carbon Market’s (‘Integrity Council’) initiative and we welcome the opportunity to comment on the draft Core Carbon Principles (CCPs), Assessment Framework (AF) and Assessment Procedure. The Bank believes that it is crucial to set a global threshold standard to build trust in the market and to establish a benchmark to identify credible and accessible high-quality carbon credits that will help scale up private climate finance towards the Paris Agreement goals. On demand-side integrity, the Voluntary Carbon Markets Integrity Initiative’s (‘VCMi’) proposed Code of Practice will encourage companies to deliver beyond their climate commitment. The collective efforts made by the Integrity Council and VCMi will be significant in giving steer to the market to address the USD95 trillion financing gap in emerging markets, where 90% of the natural climate solutions (NCA) potential sits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | In this response, we focus on areas of relevance to the Bank. We make the following key recommendations to enhance the draft CCPs assessment framework and procedure:                                                                                                                                                                                                                                                                                 |
| 3241 | Anonymous            | Ge                  |                 | Furthermore, the Integrity Council should acknowledge the work done by the standard setters over a number of years to establish robust and effective carbon crediting processes, which can be used as a basis for the high-quality threshold standard that the market needs today. More needs to be done to support continual improvement and allow comparison between those standards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 1. Develop a road map and clear goals. It is important to make clear to the market where the assessment framework stands and what can be achieved in its current state. A road map is needed to indicate how the current standards will be raised in the future. We suggest publishing a 2023 work plan by the time of the WEF meeting in Jan 2023, which would also indicate areas for further evaluation and follow up actions to enhance the CCPs. |
| 3241 | Anonymous            | Ge                  |                 | It has been a privilege to contribute to the work of the Integrity Council with our market expertise over the past two years. It is clear from previous feedback and engagement that consensus needs to be reached across the industry, especially on the Additionality and Permanence principles and how to treat project-based REDD+. As we are racing against the clock in achieving net zero carbon emissions by 2050 to keep 1.5°C alive, we advise finalising and publishing the CCPs and AF by January 2023 at the latest. Any further delay will fundamentally undermine credibility in the Integrity Council and the CCPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 2. Publish a baseline threshold of CCPs using CORSIA as a basis for governance. The Integrity Council should not be setting a new standard for carbon crediting. Instead, identifying best practices and baseline requirements at programme and standard level is critical. The Integrity Council should look to established industry bodies’ standards to form the basis.                                                                            |
| 3241 | Anonymous            | Ge                  | 0               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | a. We suggest using the Carbon Offsetting and Reduction Scheme for International Aviation (‘CORSIA’) as the starting baseline threshold that can be consistently applied across the industry. In addition, benchmarking standard setters and standardising how the project information is presented will help buyers when they purchase carbon credits.                                                                                               |

| 3241 | Anonymous            | Ge                  | 0               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | b. The Integrity Council should then encourage all standard setters that want to be considered eligible for the CCPs to apply these principles to all their methodologies, with a standard approach agreed for key criteria such as additionality, permanence, and project-based REDD+ in all its forms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3241 | Anonymous            | Ge                  | 0               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | c. The Integrity Council should have oversight of the carbon crediting programmes to independently check that these principles are being applied in full, and to assess the carbon programmes' methodologies and shortlist the types and locations that would be considered eligible for the CCPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3241 | Anonymous            | Ge                  | 0               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 3. The Additionality principle should not rely exclusively on financial additionality tests. Financial additionality can be challenging to apply in practice. Performance standards are the current best practice in the market and are already used in the Voluntary Carbon Markets to assess additionality across a project type. In addition to providing a robust additionality assessment that standardizes across project approaches, they also connect to the project baseline that standardises the credit quantification process.                                                                                                                                                                                                                                                                                                                                                            |
| 3241 | Anonymous            | Ge                  | 0               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 4. The Permanence principle requires a higher level of inclusivity. There are various approaches in the market that may or may not fit for specific activities and/or geographic locations. The Integrity Council should take a more high-level approach and establish a threshold standard that reflects market reality. There needs to be a realistic assessment of practicality and enhanced use of other approaches such as pooled buffer reserves, re-insurance, global remote sensing Measurement, Reporting, and Verification (MRV) systems development and other mitigation technologies. For instance, measurement and reliability of Natural Climate Solutions (NCS) can be improved by strengthening technological requirements in accessing MRV. Digitization can help streamline data collection and quality control in the MRV process, saving time and cost to carbon credit issuance. |
| 3241 | Anonymous            | Ge                  | 0               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 5. Sustainable Development Goal (SDG)-alignment should be considered for project attributes. SDG-alignment should be assessed against projects to signpost project activities to buyers. Separately, a system for nesting project-based REDD+ and supporting the development of Jurisdictional REDD will help mitigate climate change with natural solutions. Entrepreneurial activities in key areas are important for the growth of the market and the livelihood to local communities and indigenous groups.                                                                                                                                                                                                                                                                                                                                                                                       |
| 3241 | Anonymous            | Ge                  | 0               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 6. Establish buyer coalition to boost market confidence. Buyers are highly selective about the credits they buy, and many are cautious about which projects qualify. We suggest developing a buyer coalition that will commit to buying a certain amount of or to pay a certain price for the CCP-eligible credits. A buyer coalition will boost developers' confidence that there is market demand and that the process is worth supporting.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3241 | Anonymous            | Ge                  | 0               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | There is a need to recognise the urgency of publishing the CCPs and AF, despite various views across the industry. The way carbon credits are assessed will constantly evolve so the framework needs to reflect current market practices as much as possible. As we work together to reach consensus, we are confident that the feedback for this consultation will further enhance the effectiveness of the CCPs and AF and provide a clear direction to the market.                                                                                                                                                                                                                                                                                                                                                                                                                                 |

CONSIDER THE INCLUSION OF TROPICAL FOREST CREDITS IN THEIR CARBON MITIGATION STRATEGIES BEYOND VALUE CHAINS.</p> <p>What does financing without credits or credits issued on a precautionary basis mean?<br/> I. How could Indigenous Peoples and Local Communities benefit from these credits?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Guidelines 1 and 2 should seek the approval and participation of Indigenous Communities in developing projects to reduce and mitigate threats related to forest degradation during its exploitation by companies |
| 3242 | Anonymous            | 0                   |                 | <p>For Reference – My June 2021 Open Letter to TSVCM</p> <p>Personal Viewpoint<br/> For the public consultation phase of the TSVCM I would like to express:</p> <ol style="list-style-type: none"> <li>1. Gratitude and appreciation to the Operation Team and others at the center of the process, who have not only run an efficient process, but have also pursued a diversity of opinions in the search for a consensus position and even an objective truth, such as there is one.</li> <li>2. Hope that we adopt sound principles of governance: that those the Board of Directors should have a clear majority of independent experts, acting as individuals of integrity in the global interest; whose livelihood does not depend on the decisions of the Governance Body or the volume of credits traded. Not only will the decisions be of higher quality, but the global perception of the body will be enhanced.</li> <li>3. Concern that the TSVCM process is able to discern between views of a less vocal majority (pushing for higher atmospheric integrity, and clearer guardrails earlier) and a more vocal minority. This will no doubt be as hard in a period of “public consultation” as it was in regular TSVCM stakeholder meetings of 100-200.<br/> I would also like to advocate for:</li> <li>4. A Clear(er) PA connection: A clear and strategic connection between the TSVCM and the Paris Agreement is needed at all appropriate levels, far beyond the press releases (eg on corporate claims). To solve climate change at the speed and scale required, I believe we need to coalesce around one global carbon budget and ensure all our efforts in VCMs can become consistent with the processes and decisions that flow from the Paris Agreement.</li> <li>5. Increasing the Voice of Global South: I believe the TSVCM process and its successor are at risk of being labeled a ‘colonial, global-north, corporate’ project, if we do not rapidly and concertedly include more individuals and entities that bring a voice from the Global South and a voice from the UNFCCC process. These individuals and entities may not have been easily reached by ‘public consultation’ and may need, with appropriate consideration and nudging, to be invited to join the Board of Directors and the Expert Panel. This could be a mixture of individuals as well as ex-officio members of organizations.</li> <li>6. REDD+: The REDD+ mechanism to be recognized as a global standard, as it has been at some phases of the TSVCM process, and at some reference points in the Public Consultation material (E.g. Exhibit 6 Page 18 of the TSVCM Public Consultation TOR Terms of Reference Document). but</li> </ol> | 0                                                                                                                                                                                                                |

| 3242 | Anonymous            | 0                   |                 | <p>ACCOUNTING FOR CLIMATE RESPONSIBILITY</p> <p>Accurate measuring greenhouse gas emissions can be technically difficult but has a right and wrong answer since it deals with physical, observable flows. However, greenhouse gas accounting is focused on deciding who is responsible for flows of GHGs. Thus, GHG accounting is dependent on how responsibility is legally defined, which varies broadly across geographies and political structures.</p> <p>Answering the question of “which emissions am I responsible for?” first requires establishing the scope of the accounting system, including:</p> <ul style="list-style-type: none"> <li>• Geographic boundaries: What is the geographic area where emissions—or entities responsible for emissions—are included? (e.g., a country, a continent, the world)</li> <li>• Temporal boundaries: For what time period(s) are the emissions accounted? (e.g., a month, a year, a decade)</li> <li>• Entity types: Who are the responsible actors to whom emissions are assigned? (e.g., governments, households, corporations, vehicle owners).</li> </ul> <p>Different scopes are useful for different purposes. While the amount of greenhouse gases emitted in a given region and timeframe is a physical fact, the perceived responsibility to act to reduce those emissions changes depending on the scope of the carbon accounting system.</p> <p>The following section provides examples of three types of emission accounting system: direct emissions, consumption-based emissions and comprehensive emissions.</p> <p>Direct emission accounting assigns ownership of emissions to the emitter (the Greenhouse Gas Protocol, a global standard for corporate carbon emissions, direct emissions are known as “Scope 1” emissions. In Life Cycle Assessment (LCA), which is used for evaluating the environmental footprint of products and services, they are known as “gate-to-gate” emissions.). The emitter typically has the most direct ability to reduce those emissions: governments can incentivise reductions and penalise emissions within their borders, corporations can alter their production methods and people can turn down their heat or drive less.</p> <p>With direct emission accounting, the emissions of a cement manufacturer would only be those emitted at the cement plant itself (and by any company vehicles). The cement plant could decrease its direct emissions by, e.g., installing CO<sub>2</sub> capture or an electric kiln. However, whether such actions decrease overall emissions depends on elements beyond the scope of the cement plant, such as the fate of the captured CO<sub>2</sub> or the origin of the electricity.</p> | 0                                                                                                                                                                                                                                                                                                                                               |
| 3242 | Anonymous            | TE/ED               |                 | <p>XXXX has researched the issue of permanence extensively. We have reviewed scientific and academic publications, current commercial approaches, earlier multi-stakeholder approaches including the IC-VCM and VCM1 and developed an evidence-based, conservative approach to permanence. Our approach robustly characterises nature-based projects.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Take account of these four considerations:                                                                                                                                                                                                                                                                                                      |
| 3242 | Anonymous            | TE/ED               |                 | <p>Our key premise is that all additionally sequestered carbon, even if impermanent, confers a vital benefit to people and the planet. For example, avoided deforestation carbon is impermanent, but until all the additional sequestered carbon is released back into the atmosphere, it still confers a benefit. Improved understanding of these benefits could drive immediate, significant and vital investment in decarbonisation and mitigation activity.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <ul style="list-style-type: none"> <li>• Permanence is not a binary attribute and it is critical that sufficient provision for changes in the scientific understanding of permanence and other approaches to evaluating reversal risk is made;</li> </ul>                                                                                       |
| 3242 | Anonymous            | TE/ED               |                 | <p>We welcome the IC-VCM’s requests for input on permanence in section 9 and the consultation question ‘H’. Permanence is a key issue for the IC-VCM to address to improve offset credibility. However, we have significant concerns on the proposed approach as follows:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <ul style="list-style-type: none"> <li>• Approaches to impermanence where the risk of reversal is quantified and addressed at the point of issue of the credits, or periodically at each credit issuance, can remove or significantly reduce the requirement for compensation for reversals and should be more clearly provided for;</li> </ul> |

| 3242 | Anonymous                            | 0                   |                 | Refer to cover statement<br>The IC-VCM work is an essential part of ensuring that the VCM can make a robust and decisive contribution to limiting global warming to 1.5 °C. In general, we support all the principles. They are all important and capture most of the key aspects of establishing a credible market for trade in carbon credits with high integrity.<br>XXXX is, of course, approaching the assessment of the principles from the perspective of its major endeavour to bring about what will possibly be the world's largest plant for negative emissions with geological storage in 2026.<br>As identified by IPCC AR6, "Carbon Dioxide Removal (CDR) is a necessary element to achieve net zero CO <sub>2</sub> and GHG emissions both globally and nationally, counterbalancing residual emissions from hard-to-transition sectors. It is a key element in scenarios likely to limit warming to 2 °C or lower by 2100 (robust evidence, high agreement)." (page 12-4). The expectation is that 2.75 Gtonnes of BECCS CDR will be required in 2050 (page 12-40).<br>This is an enormous challenge, considering that no BECCS facility is operational and producing negative emissions in high quantities today.<br>This has major implications for IC-VCM and similar initiatives. The rule book that is now in the process of being agreed on the VCM has to ensure that it facilitates the development of the required removals with geological storage deemed necessary by IPCC.<br>Against this background, it is important that the IC-VCM carefully considers the difference between traditional off-sets for compensation and the negative emissions with geological storage for neutralization of emissions. In case it is not feasible to find a common rule book for these two broad categories, it should be evaluated to have a separate "annex" which could more freely develop an integrity framework suitable for negative emissions with geological storage. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3242 | Anonymous                            | 0                   |                 | Avoided Emissions - The Principles (part 2) refer to reductions and removals but do not refer to avoided emissions. Similarly (AE) are not mentioned in Part 5. It is therefore potentially not clear if projects under REDD+ will therefore be ineligible. However, in Part 5 REDD+ is mentioned under the definition of 'Mitigation Activities'. That definition possibly suggests that credits based on avoided emissions are included (under a phrase that talks about reduced emissions) but there is a lack of clarity on this.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | We suggest that if the principles are intended to include credits based on avoided emissions, then this should be made clear in the definition of Mitigation Activities.                                                                                                                                                                                                                                                                                                                            |
| 3242 | Anonymous                            | 0                   |                 | XXXXX notes that Part 2 and Part 5 do not specifically refer to avoided emissions. However, we note that REDD+ is mentioned in the definition of Mitigation Activities (in Part5).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Further to the above -- we would point out that the phrase 'Mitigation Activity' could lead to confusion by actors using the principles or stakeholders confusing the payment for the 'mitigation' with direct reductions by organisations (rather than the organisation purchasing a credit as offset). There is a possible risk of greenwash. This should be addressed, making a clearer distinction.<br>One suggestion might be to consider using the phrase Credit Related Mitigation Activity. |

| 3243 | Anonymous            | 0                   |                 | <p>Supporting Detail</p> <p>Concern We Create A Clear Paris Agreement Connection<br/>I believe the voluntary carbon markets can and should align with all aspects of the Paris Agreement if they are to help achieve its goals. As such, it is difficult to see a voluntary market existing in a parallel universe of accounting, rules, and guidance to this international treaty. Central to the Paris Agreement is global collective action, driven at a national level, affording flexibility based upon national circumstance and requiring a continual increase in ambition. While there are a number of outstanding issues over the implementation of Article 6, we do not need to use the in-process details as an excuse to ignore the principles and goals of the UNFCCC and the Paris Agreement. The rules around climate and forests have already been agreed by 192 countries, with an opportunity of key world suppliers of forest credits to be overseen by the 60+ rainforest nations, all in the 'sunlight' of a transparent process and documentation of the UNFCCC process. I am hopeful of a world that works to one global carbon budget, and fearful of a divided world with different versions of the truth.</p> <p>Hope for Sound Governance and Increasing Voice of the Global South<br/>At its core, this is a call for equity, fairness and environmental justice. We need to create that companies and NGOs are attempting to develop a carbon standard that does not involve developing countries from which many of the carbon reductions and removals may originate. In addition to equity concerns, there is a risk of 'tissue rejection' by the main supplier countries if they have not been part of the creation of the standards or the ongoing governance. To my knowledge there has not been formal consultation so they may dispute the legal validity in their jurisdiction and hamper progress.<br/>On the positive go-forward potential, clear steps can and should be taken to increase the voices of the Global South around the TSVCM table. This could be done through:</p> <ul style="list-style-type: none"> <li>• Inviting individuals with recognized expertise in national rainforest protection (eg known former Ministers of Environment of rainforest nations such as: <ul style="list-style-type: none"> <li>o Emilio Sempris (for Board?) – former Minister of Environment Panama 2017-2019, Rapporteur UNFCCC 2004-2005 (<a href="https://www.linkedin.com/in/emiliosempris/">https://www.linkedin.com/in/emiliosempris/</a>)</li> <li>o Paul DeNoon (for Board or Expert Panel?) – former SVP at Alliance Bernstein, current Director of Policy for Coalition for Rainforest Nations (<a href="https://www.linkedin.com/in/paul-denoan-ACCOUNTING FOR CLIMATE ACTION">https://www.linkedin.com/in/paul-denoan-ACCOUNTING FOR CLIMATE ACTION</a>)</li> </ul> </li> </ul> | 0                        |
| 3243 | Anonymous            | 0                   |                 | <p>There are two sides to the carbon accounting ledger. The first side, the emission accounting discussed above, measures responsibility. The second side measures the fulfilment of that responsibility via tracking actions taken to reduce emissions.<br/>Successful emission mitigation requires that there is fewer GHGs in the atmosphere than there would have been otherwise. Knowing how much carbon that we did not emit requires establishing a baseline. This baseline selecting a point of reference that is used to compare emissions before and after an action is taken.<br/>The three main mitigation activities can be defined by their point of reference:</p> <ol style="list-style-type: none"> <li>1. Emission Reduction uses a historical baseline: an amount of GHGs physically emitted by the entity at some point in the past, e.g., "GHGs emitted in the EU in 1990" or "CO<sub>2</sub> emitted in Microsoft's supply chains in 2005".</li> <li>2. Emission Avoidance uses a counterfactual baseline: an amount of GHGs that is assumed would be emitted if an activity didn't take place, e.g., "CO<sub>2</sub> emitted by clear-cutting 1000 acres of forest" or "GHGs emitted by generating 1000 kWh of electricity from coal."</li> <li>3. CO<sub>2</sub> removal uses a physical baseline: how much CO<sub>2</sub> is currently in the atmosphere, e.g., "415 parts per million" or "3210 gigatonnes".</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                        |
| 3243 | Anonymous            | GE/TE               |                 | <p>Our answer to the consultation question 'H' on the appropriate balance of requirements is in the negative. For the suppliers of credits the approach is overly onerous requiring for example calculations of reversal risk and purchases of insurance, involves too much risk taking and is of too long duration. The impact on conservation, small scale and IPLC led initiatives is likely to be disproportionately negative. It is also worth taking account of the difficulty of engaging with this consultation for many such organisations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Reconsideration required |

| 3243 | Anonymous            | GE/ED               |                 | For the XXXX, it is of great importance that the carbon credits issued for voluntary use is of high quality. This includes contributing to sustainable development. Ideally, it should therefore be enough to include only the one full stringency threshold for private companies to consider when they wish to mitigate emissions beyond their value chain, however we are also aware that it is important to stimulate the flow of funding to raise climate ambition in relation to the Paris agreement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3243 | Anonymous            | GE/ED               |                 | That being said, we welcome that the AF includes the majority of all the criteria listed already within the initial stringency threshold. However, some requirements that are listed under the full stringency threshold could have been included already under the initial, including:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 3243 | Gold Standard        | 0                   |                 | Are there principles, criteria and requirements that are not included and should be added?<br><br>Yes, requirements for existing project on receiving CCP label should be outlined. The existing VCM projects should be allowed to receive CCP label provided that the project can demonstrate compliance with the CCP requirements. Expert Panel (EP) may consider setting minimum threshold.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | We encourage EP to consider criteria such as Crediting period start date for eligibility – similar to CORISA to maintain consistency across the initiatives and adopting a vintage start date for CCP labelling for example starting from 1/1/2021. Programmes may design a transition process to facilitate CCP labelling to existing project as separate procedure or integrate within the existing certification cycle for efficient and faster transition. |
| 3243 | Anonymous            | 0                   |                 | The approach suggested for additionality seems adequate for traditional off-sets. The main challenge for traditional off-sets is that they are based on a counter-factual assessment and/or have an inherent in-value-chain-worth for the project owner. For both those reasons, it follows that it is genuinely difficult to assess the true additionality of funds coming from sales of carbon credits.<br><br>For negative emissions with geological storage the situation is completely different. They don't have any inherent in-value-chain-worth for the project owner. They are only produced for the purchaser of the negative emission rights, without the potential to come about for any other reason. The counter-factual assessment is very clear – they would not happen without the purchase of the negative emission right associated with the underlying physical removal.<br><br>There is, however, one critical limitation to this argument that must be assessed from an additionality perspective. If the project is eligible for state aid and such aid would be comprehensive enough to allow the project to meet its profitability targets without the carbon credit revenues, then – if the project receives such aid – the project would not be additional. On profitability, the rule book should welcome high profitability, since the business risk of investing in volume production of negative emissions is high – it has never been done before. Thus, for this type of mitigation outcome, IRR must not be a criteria. The criteria is simple – is the project profitable without the carbon credit revenues? Of course, to assess the profitability, there is a need to set a discount rate/WACC for the NPV calculation, with a project being considered profitable if the NPV is larger than zero.<br><br>For the certification, a project owner should, thus, be expected to be able to defend the chosen discount rate, which for negative emission projects could be much higher than a company's WACC for traditional projects. The project owner should only be expected to present a rather simple summary calculation, not the full details of the project's discounted cash flow analysis.<br><br>If there would be disagreement, the company's auditors may need to confirm that the simplified calculation is a representative summary of the full analysis. Such confirmation by the auditors may also include, if applicable, that costs and revenues have been divided in a reasonable manner between production of negative emissions and other possible products produced in connection therewith.<br><br>Of course, neither must the project be part of a compliance regime, where the project owner is mandated by law to produce the negative emissions, or the acquirer required by law to purchase such instruments. In this context it should be noted. however. that beyond 2030 it is not unlikely | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3243 | Anonymous            | 0                   |                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | ISO suggests that principles be phrased as explanatory statements rather than as requirements. By including "shall" in the phrasing of each principle, the principles become requirements.                                                                                                                                                                                                                                                                     |

| 3243 | Belinda Rowsell      | QUESTIONS           |                 | Voluntary carbon markets derive from the concept of a carbon emission offset which in turn is determined by reference to the universally accepted scientific construct of a carbon atom (or carbon equivalent). Currently, there is no agreement within the international community on how this concept (of a carbon emission offset) should be treated for domestic or cross-border tax purposes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Fiscal and monetary policy is the primary mechanism through which a sovereign state can reach its climate goals under the Paris Agreement, and each state enacts carbon regulation in furtherance of its own climate targets (be it intensity based, an absolute cap, or applicable only to specific sectors or industries), the legal framework underpinning voluntary carbon markets should be informed by the tax community so as to prevent unintended tax avoidance and evasion or the manipulation of tax disclosures, returns or reporting obligations. |

EMISSION REDUCTION<br>"Emission reduction" is used to refer two distinct concepts.<br>The first, absolute emission reduction is when the total amount of greenhouse gases emitted decreases compared to a historical baseline. With absolute reductions, fewer GHGs are physically entering the atmosphere. Massive and rapid absolute reduction of emissions is the foundation of any effective climate policy. Only by preventing further emissions of greenhouse gases can we hope to limit further catastrophic climate change.<br><br>The second type of reduction is relative emission reduction. A relative reduction is when the amount of GHGs emitted per unit decreases (e.g., per GJ of energy generated, per tonne of product, per capita, per euro of GDP), such as via increased energy or material efficiency.<br><br>Absolute reductions can occur without relative reductions, such as via demand reduction. And relative emissions reductions can result in absolute reductions, such as producing the same amount of product in a more efficient way. However, relative reductions do not necessarily result in absolute reductions: a relative reduction in emissions can occur along with an increase in the emitting activity, such as by buying a more fuel-efficient car but then driving more often—this is known as the rebound effect. A large enough rebound effect can result in an absolute increase in emissions despite a relative reduction in emissions | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3244 | Anonymous            | GE                  |                 | We welcome the IC-VCM's statement that alternative approaches to permanence are invited. 4C is developing Permanent Additional Carbon Tonnes (PACTs) as an approach that enhances the robustness of natural climate solution project characterisation. We combine cutting-edge methods for assessing additionality, a new approach to impermanence, and a transparent, self-correcting protocol for addressing uncertainty. Together these innovations allow NBS, carbon capture and storage 'CCS' and in principle any other offset projects to be compared on a like-for-like basis. We believe this has the potential to greatly increase buyer confidence, project comparability and hence sales to existing and new buyers, and as a result encourage many more viable projects to enter the market.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Take forward our recommendations that allow for approaches such as ours to impermanence where the risk of reversal is quantified and addressed at the point of issue of the credits, or periodically at each credit issuance that remove or significantly reduce the requirement for compensation for reversals.                                                                                                                                                                                                                                               |
| 3244 | Anonymous            | GE                  |                 | What timeframe would you recommend for the duration of the initial threshold, taking into account the time needed for carbon-crediting programs to revise standards, processes and procedures; carbon-crediting periods; issues related to legal contracts etc.?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3244 | Anonymous            | GE                  |                 | Is this different for different areas of the draft Assessment Framework? Are there other key considerations that should be explored?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Only information that constitutes critical business information, like the detailed NPV analysis as mentioned above, should not be expected to be available to the public.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3244 | Anonymous            | 0                                    |                 | The wording of this principle poses two challenges.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Proposed restatement:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3244 | Anonymous            | 0                                    |                 | First, the principle states that the carbon crediting program is responsible for providing “clear guidance, tools and compliance procedures”. We understand that this guidance and procedures will be informed by section 7 of the Assessment Framework and section F of the Summary for Decision Makers. While this approach provides flexibility to the carbon crediting programs, which may be necessary and appropriate, it opens the door to disparate approaches among programs. These differences, if substantial, would lead to differentiation that market participants could consider affect the relative quality of one program’s carbon offset versus another program’s carbon offset. Thus, instead of focusing the principle on the definition of carbon credit quality, the principle opens the door to multiple interpretations of carbon credit quality. | “Carbon-crediting programs provide guidance, tools, and requirements to ensure mitigation activities are accompanied by safeguards that ensure net-positive social outcomes and protection of the environment.”                                                                                                                                                                                                                                                                                                                                                          |
| 3244 | Anonymous            | 0                                    |                 | Second, the principle states that the “clear guidance, tools and compliance procedures” will ensure that mitigation activities “conform with or go beyond widely established best industry best practices on social and environmental safeguards while delivering on net positive sustainable development impacts.” Again, there are two standards invoked here. One is to conform to “best industry best practices”, the other is to exceed them. ISO is concerned that carbon credit quality will not be clearly defined if there is a range of performance measures on which to evaluate the implementation of this principle.                                                                                                                                                                                                                                         | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

EMISSION AVOIDANCE</p> <p>Emission avoidance is the assumption that, in an alternate reality, more GHGs would have been emitted than is being emitted now. Avoidance can be attributed to active interventions, such as employing a local population to actively protect a forest from loggers, fires, and pests, or passive interventions, such as not exercising clear-cutting rights and leaving a forest standing. Such avoidance activities, e.g., preventing deforestation, increasing renewable energy generation are critical for preventing additional increases in greenhouse gas emissions.</p> <p>However, since the amount of greenhouse gases avoided is dependent on the selection of a counterfactual scenario—what would have happened otherwise—the exact amount of emission avoidance is inherently unverifiable and easily manipulated. In the avoided deforestation scenario, it may be assumed that total deforestation would have occurred otherwise, rather than assuming some or all of the trees would have been left standing—regardless of the original intentions or plans of the forest owner. Furthermore, avoidance activities can have knock-on effects, such as the protection of one forest shifting deforestation to another (so-called ‘indirect land use change’), that are equally difficult to attribute and quantify. Therefore, while avoidance activities themselves may be of critical importance, the usefulness of quantifying emission avoidance activities by the amount of “CO<sub>2</sub>(eq) avoided” is limited.</p> <p>A cement plant produces cement that is used to build an energy efficient building. The cement producer then claims that, if their cement wasn’t used, a less efficient building would have been constructed, resulting in higher energy demand and higher fossil fuel use. The cement plant then claims as an avoidance the estimated CO<sub>2</sub> not emitted from the possible non-use of fossil fuels in the energy efficient building. No changes to the emissions of cement production itself occur.</p> | 0                                                                                                                                                                     |
| 3245 | Anonymous            | ED                  |                 | The IC-VCM has an important role but it has not been set up to restrict use of offsets. Were an appropriate public body to rule that ‘When the carbon stored in a reservoir, as a result of mitigation activity, is released to the atmosphere, it can no longer be considered an offset to GHG emissions’ this should be referenced in the consultation and/or subsequent document. The high standing of the IC-VCM is such that the current consultation statement may still inhibit companies’ buying NBS credits which carry reversal risks but are much needed to address the climate crisis. The statement should be removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Remove:                                                                                                                                                               |

| 3245 | Anonymous            | GE                  |                 | In addition to the AF by the Integrity Council, there are other similar initiatives with the goal of establishing best practice for the VCM that recently have published draft frameworks. In order to secure robust standards for the VCM, stakeholders would benefit from further dialogue, cooperation, and coordination with each other. Actors of interest include those involved in the EU taxonomy development and CSRD, ambitious companies (in terms of climate and sustainability), the UN Secretary-Generals Expert Group on the Net-Zero Emissions Commitments of Non-State Actor, the SBT-i, and the Nordic Code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                     |
| 3245 | Gold Standard        | 0                   |                 | What timeframe would you recommend for the duration of the initial threshold, taking into account the time needed for carbon-crediting programs to revise standards, processes and procedures; carbon-crediting periods; issues related to legal contracts etc.?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Six to nine months from publications, however where needed AF may include forward actions with timebound implementation.                                              |

| 3245 | Anonymous            | 0                                    |                 | <p>This is a critical principle. The confusion of what it implies and how the accounting of companies and nations relate to one another needs to be clarified and settled. The current situation is threatening the necessary investments that the private sector can and must contribute to climate mitigation.</p> <p>The reason for the current confusion is that a mixing of the corporate accounting system with the national/governmental accounting system has been introduced in the debate about the nature of carbon credits. When the two accounting systems are kept separate, then the question of double counting, including double issuance, double claiming and double use, becomes relatively straightforward and the principles outlined in the document are supported. The problem occurs when the concept of double claiming is applied across the two accounting systems.</p> <p>The main argument for applying the notion of double claiming across the two accounting systems, as suggested by proponents of this view, is the potential risk that nations would lower their climate ambitions if they could rely on the corporate sector to achieve their NDCs. There are multiple problems with this argument. First, if ever true, it would only apply to a small minority of nations (which, while part of the Paris Agreement, neither are committed to limiting global warming nor have understood that resisting decarbonization will undermine their economies already by mid-century). To the extent that this would entail larger countries, such countries would irrespective of the accounting rules find ways not to honour their commitments. Thirdly, if this is considered a real problem, nations must address it with a real solution. The real solution is that all countries must set up emission reduction trajectories, per sector, as part of their NDCs and be held accountable towards these trajectories.</p> <p>With such trajectories, the VCM could establish rules not to engage in projects in host nations which consistently fail to meet their reduction trajectories. Also, with such trajectories, we could turn the current VCM-hostile discussion into a positive discussion on how corporations could help nations to reach their NDCs.</p> <p>As for negative emissions with geological storage, the notion that the engagement of the VCM could threaten climate ambition is simply a contradiction in terms. The removal projects with geological storage are among the most ambitious projects that can be conceived.</p> <p>Interpreting/applying Article 6 of the Paris Agreement such that the accounting systems of the corporate sector and nations would be mixed would, contrary to the argument in favor of such interpretation, more likely result in a lowering of ambitions since it would prevent public-private co-funding of critical projects. in general reduce the capital contributed by the private sector to</p> | 0                                                                                                                                                                                                                                                                                                                                                                                                                      |

CO2 REMOVAL</p> <p>The removal of greenhouse gases from the atmosphere, typically CO<sub>2</sub>, is different than emission avoidance or reduction in that it is a process that physically extracts CO<sub>2</sub> from the atmosphere, rather than preventing the increase of CO<sub>2</sub>. CO<sub>2</sub> can be removed by enhancing natural processes (CO<sub>2</sub> already naturally removed by ecosystems does not qualify as Carbon Dioxide Removal.), such as photosynthesis of biomass or weathering of rocks or by engineered chemical reactions. (<a href="https://cdrprimer.org/read/chapter-2">https://cdrprimer.org/read/chapter-2</a>)</p> <p>A cement plant switches to a biobased fuel source and installs CO<sub>2</sub> capture. The captured CO<sub>2</sub> is sent to geological storage. If the emissions associated with the biofuel production and the CO<sub>2</sub> capture and storage and their supply chains are less than the amount of biogenic CO<sub>2</sub> captured and stored, the cement plant results in net carbon dioxide removals.</p> <p>The goal of carbon dioxide removal is to reduce the amount of greenhouse gases in the atmosphere. However, extracting CO<sub>2</sub> from the atmosphere is by itself insufficient to result in a decrease of atmospheric greenhouse gases. The CO<sub>2</sub> must then be permanently kept out of the atmosphere. Furthermore, the amount of CO<sub>2</sub> and other GHGs emitted in the process of removing and storing the CO<sub>2</sub>—and the associated supply chains (As in the “comprehensive emission accounting”, above.) — must be less than the amount of CO<sub>2</sub> removed and stored. It is this net removal amount, rather than the amount that was extracted from the atmosphere that is the amount by which the CO<sub>2</sub> in the atmosphere decreases and thereby the number by which removals should be quantified.</p> <p>Finally, offsetting is not an activity that reduces, avoids, or removes emissions. Offsetting is the exchange of ownership of the emission reduction, avoidance, or removal activity to a second entity who then claims that those reductions/avoidance/removals balance out their own continued emissions. Effectively, offset is the trading of responsibility.</p> <p>Offsetting is based on the—often false—assumption that reductions, avoidance, and/or removal activities are both equivalent and fungible. Paired with the assumption that markets are efficient, entities with difficult to-reduce emissions thus pay entities who can more easily reduce their emissions to do so, resulting in the same total reduction at a lower price. However, this requires ensuring that the boundaries and baseline used by all entities are the same so that each offset exchanged is a measurable tonne of CO<sub>2</sub>(eq).</p> | 0                                                                                                       |
| 3246 | Anonymous            | ED                  |                 | <p>We dispute the factual accuracy of the statement ‘Temporary carbon storage, even over long periods cannot substitute for permanent emission reductions’ as there are economic approaches to enable the social value of impermanent storage to be estimated and guide decision making according to the relative costs and benefits. While many of the current Standards’ methodologies do not sufficiently deal with impermanence it is critical that provision is made by the IC-VCM for new methodologies that can do so. The statement and subsequent sentence should be modified.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Remove or modify:                                                                                       |

Added focus on this would make the VCM relevant for the private sector. Essentially, this would be achieved by answering questions around how the private sector can use the emission reductions. Here SBTi and others mentioned above may help.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0                                                                                                       |
| 3246 | Gold Standard        | 0                   |                 | Is this different for different areas of the draft Assessment Framework?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Refer to comment above.                                                                                 |

| 3246 | Anonymous            | 0                   |                 | <p>It is agreed that there should be clear and robust rules to compensate for reversals. However, the way the principle is formulated seems to extend beyond the details of the Assessment Framework. Nevertheless, the suggested risk-based approach is sound, as is the distinction between Avoidable and Unavoidable reversals.</p> <p>Avoidable reversals, interpreted as caused by negligence or inadequate monitoring or storage solutions, should always be fully compensated and should be a risk carried by the party responsible for the carbon storage pool. As suggested in the text, there is no need for a buffer pool for this situation.</p> <p>To truly represent a removal, the CO<sub>2</sub> must be removed for at least 300 years, preferably more than 1 000 years, depending on the reading of the half-life of CO<sub>2</sub> in the atmosphere. While the appropriate length needs further discussions in academia, a 300 years bar represents a real challenge for nature-based solutions. The VCM may have to entirely rethink the way it works for nature-based methods, with credits being issued for a pre-defined time span, after which they must be renewed (or to achieve a longer time span, multiple credits have to be acquired for the same emission).</p> <p>For unavoidable reversals, negative emissions with geological storage are, again, different from other mitigation instruments. The main reasons are:</p> <ul style="list-style-type: none"> <li>•The scientific evidence suggests that the risk of reversal is minimal.</li> <li>•With already a high cost, adding additional cost will impact the demand compared to cheap off-sets, and will make it more difficult to reach the volumes needed to address residual emissions in time to limit global warming to 1.5 °C.</li> <li>•A buffer pool may not be feasible. If, against the scientific evidence, there is an unavoidable event, then the buffer pool may also be consumed. It is not realistic to assume that a project will have the capability to store CO<sub>2</sub> at two different sites, for logistical cost reasons.</li> <li>•Governments will be involved in determining how reversals should be handled, with governments taking on the responsibility for reversals, at least after a certain period following the closure of the storage site. These solutions may differ from region to region.</li> </ul> <p>Against this background, the IC-VCM should tread more carefully regarding reversals for negative emissions with geological storage. Specifically, for the EU region any solution must be compatible with the CCS and ETS directive and the CRC-M mechanism.</p> <p>It is also conceivable, considering the current scientific evidence in combination with the expected government regulations mentioned above as well as the need to accelerate demand, that there</p> | 0                                                                                                                                                         |
| 3246 | Anonymous            | 0                   |                 | <p>XXXX generally supports the use of up-to-date Global Warming Potentials as these are expressed in IPCC assessment reports. For example, ISO 14064 Greenhouse gases—Part 1: Specification with guidance at the organizational level for quantification and reporting of greenhouse gas emissions and removals, states “The latest IPCC’s GWP should be used. If not, justification shall be provided. The GWP time horizon shall be 100 years. Other GWP time horizons may be used but reported separately.” This international standard used “should” instead of “shall” for valid reasons. These include regulatory program requirements that impose the use of a specific set of GWPs and the fact that some projects rely on tools that have certain GWPs built into them. For example, the “Oil Production Greenhouse Gas Emissions Estimator” (OPGEE, version 2.0), uses GWPs from the IPCC AR4. This tool was developed by Stanford University and is approved for use by the California Air Resources Board which operates carbon-crediting mechanisms such as the Low Carbon Fuel Standard and the Cap-and-Trade program. Revisions to program requirements do occur but often require several years to implement. (Stanford University is working on version 3 of OPGEE, for example.) ISO believes that a blanket requirement for the use of a particular set of GWPs would be disruptive to the market and not enhance quality in a meaningful sense as the differences among the GWPs are well-known.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | For transparency, where an alternative to GWP100 is used as the basis, this should be clearly referenced and GWP100 calculations should also be provided. |

| 3246 | Barbara Haya         | 0                   |                 | <p>On Jurisdictional REDD+ generally The proposed CCP assessment framework and process contemplates ways to accommodate assessing jurisdictional programs against the CCP standard. The standard aims to assess whether credits can be confidently treated as equivalent to reducing fossil fuel emissions and be tradable with those emissions to meet a carbon target or claim carbon neutrality. Jurisdictional REDD+ standards (e.g. ART TREES, VCS JNR) are unable to meet the CCP standard to be considered as offsets and should not be considered eligible for the CCP stamp. Individual jurisdictional programs can be very worthwhile supporting, but a standard, like ART TREES, is unable to see whether jurisdictional REDD+ programs meet the CCP criteria. The information needed to assess whether a jurisdictional REDD+ program does not cause harm and meaningfully addresses the drivers of deforestation for long-term (permanent) forest conservation needs deep grounded knowledge of the particular jurisdictional program. The proposed assessment framework does not, and is unable to, require that standards use the levels of knowledge to make expert assessments. The jurisdictional standard, e.g. ART TREES, creates a set of standards that can be verified by a third-party verifier. A third-party verification system is structured to assess a project against an objective set of criteria. The CCPs, one step above the jurisdictional standard, will have a hard time assessing whether a jurisdictional standard effectively sees whether proposed jurisdictional programs effectively and permanently address the drivers of deforestation in the particular context and have low risk of harm. Safeguards &amp; REDD+ (project based and jurisdictional) involves high risk of harm. This is evidenced by a large literature on REDD+ projects that have caused harm. Many if not most case studies of REDD+ projects (REDD-readiness, pilot projects, results based payments, and offset projects) document some level of harm, from fomenting tension within a forest community, to restricting communities from their traditional use of forests, to displacement of villages, to violent suppression protest. The types of activities incorporated into project-based REDD+ programs are many of the same types of activities used by existing and proposed jurisdictional programs, such as the establishment of conservation areas, alternative livelihood programs, and land use restrictions. This literature strongly shows that REDD+ projects have a high risk of harm. Studies on safeguard standards show that the safeguard standards proposed by the CCP framework can help reduce the risk of harm, especially of the most egregious abuses, but are insufficient to ensure harm is avoided. The reason is that it is hard for a third party verifier to know whether safeguard requirements were carried out fully or superficially. Drivers of deforestation &amp; Global Forest Watch data on deforestation rates shows high levels of variability year-to-year in deforestation rates across sub-national and national</p> | <p>Jurisdictional REDD+ should not be considered as eligible for receiving a CCP stamp. The challenges of ensuring harm is not caused by a jurisdictional REDD+ program given that safeguard standards on their own are insufficient to prevent harm, and that the credits represent real, additional, and permanence reductions means that JREDD+ should not be considered for a CCP stamp.</p> |

The accounting of emissions, of non-emissions (reductions and avoidance), and of removals does not, by itself, affect the atmosphere. Instead, carbon accounting affects people—by assigning emissions to individual, corporate, governmental, and other actors, carbon accounting quantifies the responsibility to act to reduce those emissions. Greenhouse gas accounting also allows us to quantify the fulfilment of that responsibility and to trade ownership responsibility and actions between actors. Thus, carbon accounting does not necessarily represent a one-to-one relationship with physical carbon, as the responsibility to act may lie with several actors, or gaps in responsibility may exist. Furthermore, the trading of reductions, via offsetting, may result—on paper—in a responsibility being fulfilled, it does change that physical carbon is still being emitted to the atmosphere. And as long as atmospheric greenhouse gases are still increasing, we have a collective responsibility to act.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                                                                                                                                                |
| 3247 | Anonymous            | ED                  |                 | <p>As above in response 6 - We dispute the factual accuracy of the statement 'Temporary carbon storage, even over long periods cannot substitute for permanent emission reductions' as there are economic approaches to enable the social value of impermanent storage to be estimated and guide decision making according to the relative costs and benefits. While many of the current Standards' methodologies do not sufficiently deal with impermanence it is critical that provision is made by the IC-VCM for new methodologies that can do so. The statement and subsequent sentence should be modified.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Remove or modify:                                                                                                                                                                                                                                                                                                                                                                                |

| 3247 | Anonymous            | TE                  |                 | General comment on sustainability:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                     |
| 3247 | Anonymous            | TE                  |                 | In a best-case scenario, we think that the VCM should learn from the Article 6 discussions: projects within this space need to contribute to accelerating mitigation – meaning that mitigation projects should be both transformative and ambitious. If there is no corresponding adjustment (CA), purchases of emission reductions from these ambition-raising mitigation projects from the VCM could be mentioned in corporate sustainability reporting as goodwill projects. If there is a CA, a claim connected to net-zero could then be made, in accordance with the Paris Agreement (e.g. Science-Based Targets Initiative).                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                     |
| 3247 | Anonymous            | TE                  |                 | We find that the AF is ambitious with regards to sustainable development, something that is important to the XXXX. Our own extensive analysis of Article 6 of the Paris Agreement, and in particular the integration of sustainable development in the activities therein, indicates, in short, that a high ambition in this domain should require:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                                                                                                                                                                     |

| 3247 | Anonymous            | 0                   |                 | XXXX supports the inclusion of criteria that can help determine the quality of carbon credits. However, the criteria need to be capable of objective assessment. This is why ISO 14064 Greenhouse gases—Part 3: Specification with guidance for the verification and validation of greenhouse gas statements includes the requirement that a verifier/validator “shall assess the suitability of the criteria proposed by the client. . . . Criteria shall be relevant, complete, reliable and understandable. It shall be available to the intended user. The criteria shall be referenced in the opinion.”                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                     |
| 3247 | Anonymous            | 0                   |                 | XXXX is concerned that requirement c) 4) in Table 25 does not meet the tests for suitability of criteria. The proposed requirement states “The carbon-crediting program shall require disclosure of information to assess the compatibility of the mitigation activity with achieving net-zero emissions by mid-century.” Such a requirement fails the tests of completeness, reliability, and understandability. Instead, assessing conformity with this requirement requires not only a high level of sector expertise but also a large amount of professional judgment. It requires the ability to forecast information about the future. Predicting the future is inherently uncertain, which is why ISO 14064-3 requires, with each validation opinion, the disclaimer that “actual results may differ from the forecast as the estimate is based on assumptions that may change in the future.” | 0                                                                                                                                                                                                                                                                     |
| 3247 | Anonymous            | Table 44            |                 | Permanence is fundamental to the market realising its purpose to reduce atmospheric concentrations of CO <sub>2</sub> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | For sequestration project this integrity principle is challenging due to the intergenerational commitment to 100 years, however we consider that a 50+year Option for the Initial Threshold seems too light and not aligned with current international best practice. |

| 3247 | Anonymous            | 0                   |                 | <p>Relating to Gabon. Target: reduce GHG emissions, including LULUCF sub-sectors, by at least 50% relative to business as usual by 2025. This equates to 3% above 2000 levels in all sectors covered, or a 72% increase if LULUCF emissions are excluded. While Gabon claims to have measures in place to protect the role of its forests in increasing carbon stocks, it has chosen to exclude this activity from its NDC. ☒ Priority mitigation sectors: renewable energy, in particular hydroelectricity, treatment of wastewater and other waste, energy efficiency, technology transfer, land use, both in land use planning and in agricultural and forestry projects. It aims to obtain 20% electricity from gas by 2025, 80% from hydroelectricity by 2025. Regarding LULUCF, to have emissions of -68% by 2020 compared to the reference scenario. With regard to waste, -16% of emissions by 2020 compared to the reference scenario. Sustainable forestry is an important element.</p> <p>Sustainable forestry remains a priority and is also an emerging part by 2025. Green Gabon is one of the three pillars of the program and deals with food security, sustainable fisheries and the establishment of sustainable forest management practices. The 2012 Climate Plan also aims to preserve tropical forests and manage industrial emissions. With regard to hydropower targets, in 2010 fossil fuels accounted for 59% of total installed power generation capacity, while the remaining 41% came from hydropower plants.</p> | 0                                                                                                                                                          |
| 3248 | Anonymous            | ED                  |                 | That impermanent storage is included is vital and should not be undermined by statements such as 'It is, therefore, a policy choice rather than a purely scientific one to reflect this value in the context of carbon markets'. The sentence should be modified to be inclusive such as along the lines of 'It is an important policy choice to reflect the extent to which temporary storage is valued in the context of carbon markets'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Replace 2nd sentence with: 'It is an important policy choice to reflect the extent to which temporary storage is valued in the context of carbon markets'. |

| 3248 | Anonymous            | 0                   |                 | <p>All the requirements suggested are welcomed.</p> <p>For negative emissions with geological storage, the Code should, however, be more ambitious. Regarding the registry itself, there should be a requirement to keep track of all negative emissions rights in the world. Thus, registries should be required to be part of a registry-of-registries. The top-level of such a registry system for negative emissions with geological storage could be maintained by the UN. In the scenario where the notion of double claiming across the corporate and national accounting systems is rejected, for each physical negative tonne there would be two “twin” certificates, connected to one another through a numbering scheme:</p> <ul style="list-style-type: none"> <li>•One of the certificates is awarded to whoever has financial control over the value chain, usually the owner of the carbon capture plant. This certificate is tradeable between companies both nationally and across national borders, but only between companies, not between companies and nations or between nations;</li> <li>•The second certificate belongs to the state in the nation where the owner of the first certificate is active and may be traded between nations within the framework of existing regulations, but not between the nations and companies, or between companies.</li> </ul> <p>With such a set-up, there would be full transparency of the application of negative emissions with geological storage and how the VCM contributes to the achievement of national climate objectives. The question of double counting would be resolved, and it would lay the ground for a much need comprehensive global trade regime between – on the one hand corporations and on the other between nations – that could accelerate the supply and demand of negative emissions. Such a platform for trade in negative emissions with geological storage with standardized certificates driving liquidity, symmetrical information and minimized transaction costs is a missing piece in the current global framework for climate mitigation. In annex, a detailed proposal of what such standardized certificates should include is presented.</p> <p>In case Article 6 would need to be amended to allow for such a global trading platform for negative emissions with long-duration storage, governments should, already at COP 27, start a discussion on the necessary adjustments with a view to accelerate the build-out of a global industry for permanent removals that can neutralize residual emissions in time to limit global warming to 1.5 °C. As regards Table 24 item c), the criteria should not be whether the project is authorized or not under Article 6, since it may discriminate national and international VCM trade. Thus, the key is not whether a Corresponding Adjustment has taken place or not. The key criteria is whether or not the carbon credit “may contribute to a national climate target”, or not.</p> | 0               |
| 3248 | Anonymous            | 0                   |                 | <p>XXXX generally supports the inclusion of environmental and social safeguards in mitigation programs. However, we would urge the IC-VCM to rethink its approach to section 7 as the criteria described in this section frequently do not lend themselves to verification as this term is defined in ISO 14065 and ISO 14064-3. According to ISO 14065, verification is a “process for evaluating whether an environmental information statement based on historical data and information to determine whether the statement is materially correct and conforms to criteria” (3.3.15). Verification requires agreement on suitable criteria as these are defined in definition 3.3.20: “policies, procedures or requirements used as a reference against which the environmental information statement is compared.” Verification occurs at a “point in time.” In other words, it looks back over a discrete prior period, usually called a “reporting period.” The verification team assesses evidence against criteria and reaches conclusions. The team drafts a verification opinion and after review, the body that employed the team issues an opinion reflecting the conclusions of the team. This ends the engagement with the client for that reporting period.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0               |
| 3248 | Anonymous            | 0                   |                 | <p>Concerns exist on the assessment criteria described in section 7 of the Assessment Framework lack sufficient specificity to lend themselves to verification. For example, Criterion 7.2: Labour Rights and Working Conditions describes the criterion as follows: “The carbon-crediting program shall have guidance and procedures that enable mitigation activity proponents to effectively assess, manage and monitor labour-related impacts and risks and ensure labour rights and working conditions.” Table 27 provides requirements for this criterion that includes:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0               |

| 3248 | Anonymous            | 0                   |                 | We would draw the attention of IC-VCM to the imprecise nature of these requirements. We provide 0 examples (with emphasis added) of the “Requirements” in the IFC Performance Standard 2 to illustrate how they include words subject to broad ranges of interpretation and as a result fail to provide verifiable criteria:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |

| 3248 | Anonymous            | 0                   |                 | 8. The client will adopt and implement human resources policies and procedures appropriate to its size and workforce that set out its approach to managing workers consistent with the requirements of this Performance Standard and national law.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0               |
| 3248 | Anonymous            | 0                   |                 | 9. The client will provide workers with documented information that is clear and understandable, regarding their rights under national labor and employment law and any applicable collective agreements, including their rights related to hours of work, wages, overtime, compensation, and benefits upon beginning the working relationship and when any material changes occur.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0               |
| 3248 | Anonymous            | 0                   |                 | Working Conditions and Terms of Employment 10. Where the client is a party to a collective bargaining agreement with a workers’ organization, such agreement will be respected. Where such agreements do not exist, or do not address working conditions and terms of employment, the client will provide reasonable working conditions and terms of employment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3248 | Anonymous            | 0                   |                 | 11. The client will identify migrant workers and ensure that they are engaged on substantially equivalent terms and conditions to non-migrant workers carrying out similar work.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |
| 3248 | Anonymous            | 0                   |                 | 12. Where accommodation services are provided to workers covered by the scope of this Performance Standard, the client will put in place and implement policies on the quality and management of the accommodation and provision of basic services. The accommodation services will be provided in a manner consistent with the principles of non-discrimination and equal opportunity. Workers’ accommodation arrangements should not restrict workers’ freedom of movement or of association.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0               |
| 3248 | Anonymous            | 0                   |                 | What these “requirements” have in common is that they define goals and process requirements, rather than actual performance standards such as “workers shall not work shifts longer than 8 hours without compensation for overtime.” ISO points out that the existence of a process requirement, such as the adoption of policies and procedures, does not “ensure labour rights and working conditions.” Certainly a verifier could ensure that policies and procedures of a specified type existed in an organization but doing that could not provide assurance that the policies and procedures were broadly implemented, enforced, and effective.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0               |
| 3248 | Anonymous            | 0                   |                 | XXXX notes that certification of organizations is used in other contexts to provide confidence to stakeholders that an organization has established and maintained policies and procedures to achieve certain objectives. ISO 45001, Occupational health and safety management systems—Requirements with guidance for use, is a standard that organizations can implement to improve its management of occupational health and safety. Moreover, independent third-party certification organizations exist to assess the effectiveness of an organization’s implementation of such a management system standard. Such third parties perform audits prior to certification and establish a schedule of surveillance audits to ensure continuing conformity with requirements of the standard. Certification typically applies on a forward-looking basis over a three-year period and is renewable. XXXX further notes that certification does not ensure that deviations from the standard will not occur. However, when they do occur the organization’s management is more likely to detect the nonconformity and to take action to correct it than organizations without an effective management system. | 0               |
| 3248 | Anonymous            | 0                   |                 | In addition to occupational health and safety, the following ISO management systems standard is relevant to social and environmental safeguards:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0               |

| 3248 | Anonymous                      | 0                                    |                 | The main point that XXXX wishes to make with respect to section 7 of the Assessment Framework is that verification standards are not suitable for offering assurance on criteria that cannot be objectively assessed against specific requirements. On this point XXXX finds that the requirements in section 7 are not sufficiently specific and therefore do not lend themselves to verification. The IC-VCM may wish to consider mandating certification rather than asking carbon-crediting programs to include generalized social and environmental safeguard requirements in their criteria.                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                              |
| 3248 | Anonymous                      | 0                                    |                 | The requirement to have all projects carry out an approved and verified SDG assessment maybe beyond the resource capacity for small scale projects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Requiring an approved and verified SDG assessment at the program level and allowing projects to report on SDGs they are positively impacting may provide the balance of ensuring safeguards are met whilst still enabling small scale projects to participate. |
| 3248 | Anonymous                      | 0                                    |                 | Relating to Gabon. No, the NDC does not envisage any form of national carbon pricing. It does, however, briefly address international carbon markets and provides that non-domestic credits cannot be used to assess national emission reduction targets under the NDC, i.e. it expressly disclaims reliance in the international market to achieve this national objective. It makes no further mention of carbon pricing. Although the translation of the NDC indicates that the country is considering "the implementation of a market mechanism induced by the law on the orientation of sustainable development", the NDC describes the mechanism of this law as simply requiring an evaluation the environmental impact that requires mitigation and compensation measures for unavoidable environmental impacts, and it is argued in the NDC that this is similar to the measure, reduce and offset approach of other examples of carbon pricing. EIA is not generally considered a form of carbon pricing. | 0                                                                                                                                                                                                                                                              |
| 3249 | Anonymous                      | ED                                   |                 | As above in response 8 - That impermanent storage is included is vital and should not be undermined by statements such as 'It is, therefore, a policy choice rather than a purely scientific one to reflect this value in the context of carbon markets'. The sentence should be modified to be inclusive such as along the lines of 'It is an important policy choice to reflect the extent to which temporary storage is valued in the context of carbon markets'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Replace 2nd sentence with: 'It is an important policy choice to reflect the extent to which temporary storage is valued in the context of carbon markets'.                                                                                                     |
| 3249 | Anonymous                      | GE                                   |                 | See above. Beyond this, we see a point in aiming for ambitious and transformative projects that may require joint efforts in terms of funding and capacity building.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                                                                                                              |
| 3249 | Gold Standard                  | Table 1, e)                          |                 | Programmes are expected to ensure the competence to have robust governance and operations across its all functions. This requirement doesn't not seem to have much relevance to the use case of offsetting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Should be removed from AF                                                                                                                                                                                                                                      |

| 3249 | Anonymous                      | 0                                    |                 | Relating to Gabon. Vulnerable Twenty (V20) 4th Ministerial Communique, Bali -Indonesia, October 14, 2018- Gabon is a member of the V20 Group of Finance Ministers. The 4th Communique sets a direct goal to accelerate fossil fuel subsidy reform and support carbon pricing efforts. The V20 is committed to advancing the implementation of national carbon pricing mechanisms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                                                                                                                                                                                                                                              |
| 3250 | Anonymous                      | TE                                   |                 | We agree that 'It is unrealistic, for example, to expect compensation mechanisms to be maintained in perpetuity'. However, the proposed durations of compensation risk are not explained and risk being excessive and counterproductive. The danger is that where there is too great a burden it is either not taken on in the first place or not taken seriously. The impact on viable NBS projects particularly smaller ones is that they do not develop at scale and hinder vital near term carbon mitigation. The approach should be modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Reconsider as at risk being excessive and counterproductive.                                                                                                                                                                                                   |

| 3250 | Individual/employee, Carbonext | 0                   |                 | <p>Firstly, Carbonext would like to express its appreciation for the opportunity to respond to the public consultation on the IC-VCM ;s Core Carbon Principles, Assessment Framework and Assessment Procedures. The growing attention and interest in the voluntary carbon market (VCM) fortunately demonstrates a large-scale concern with the troubling issues of climate change. In view of this accelerated growth, Carbonext not only supports but truly believes that it is of great importance to develop mechanisms that allow the identification of high-quality credits which create real, effective, and verified positive impacts on climate, environment, and society. Therefore, we recognize the importance of the effort to develop the Core Carbon Principles. Despite of its importance, we have concerns regarding the criteria and requirements laid out in the Assessment Framework. As it is currently presented, the principles proposed would hamper the market, as the assessment methodologies in many cases do not currently exist or cannot easily be applied. We will provide our overview of the CCP below and, then, will comment on some criteria we consider need high attention and reconsideration. Overview on Natural Climate Solution and project-based REDD</p> <p>One general aspect, we became concerned with the text largely silent on Natural Climate Solutions (NCS) projects, with the exception of jurisdictional REDD+ programs. As described, many of the requirements proposed in the Assessment Framework, especially regarding additionality and permanence, would not be possible to be met by NCS projects. Which would exclude all projects of the type from being applicable as CCP credits and therefore, CCP credits would likely not include credits from natural carbon sinks. At the date, forestry and land use change credits correspond to the largest fraction of credits generated in the voluntary carbon market. NCS have the biophysical potential to provide a third of the reductions and removals needed to meet Paris targets. Furthermore, one of the main reasons for this is the growing interest of the market in this type of credit, since in addition to the climate issue, NBS credits provide benefits to the community, biodiversity, soil, and water quality where they operate. In Brazil, for example, the role of preserving the integrity of the Amazon Forest goes far beyond the climate and biodiversity gains: it benefits the entire water cycle in South America. Which, in turn, contributes to water, food and energy security of more than thousands of people [1]&lt;sup&gt;,[2]&lt;/sup&gt;. Assessing the importance of fomenting the conservation of tropical forests on an even broader scale, highlights the importance of their preservation beyond the carbon emission/sequestration issues. A research work developed by Lawrence and Vandecar published in Nature Journal in 2014[3] is one of the many high quality research projects that clearly demonstrate the crucial need to preserve tropical forests regarding the global climate. The result from this paper shows the</p> | One general aspect, more attention should be given to Natural Climate Solutions (NCS) projects, beyond jurisdictional REDD+ programs and also including forest project-based credits also eligible for CCP credits. |

| 3250 | Anonymous            | 0                   |                 | <p>Relating to Gabon. CDM: Gabon does not have individual CDM projects registered with the UNFCCC and does not have an action programme. REDD+: Currently, Gabon does not appear to have any registered REDD projects, but has recently entered into a transaction with Norway (see below). Gabon is one of the 11 countries of the Congo Basin, the second largest tropical forest after the Amazon Basin, with an area of 250m ha. About 11% of the country was designated for the creation of 13 national parks in 2002. Much of the rest was dedicated to industrial logging and mining concessions. The expansion of forestry and mining is expected to intensify due to economic growth and structural dependence on natural resources. These sectors are also expected to increase their relative contribution to the economy due to the continued decline in oil production. In recognition of this, the government has placed the preservation and sustainable use of natural heritage at the heart of its development strategy. Currently, Gabon is part of the Central African Forest Initiative (CAFI) which aims to support REDD+ in Central Africa and includes, among other things, the development of national investment framework commitments. Gabon is preparing a National Investment Framework which will be submitted for review by CAFI (Central African Forest Initiative). It is expected to include a monitoring system and long-term towards observation them of natural October resources 2019, announced in Norway a \$150 million contract with Gabon under the CAFI under which it will receive payments to conserve its forests. Norway will pay Gabon \$10 for every ton of carbon not emitted, compared to the Central African country's annual average between 2005 and 2014, and up to a maximum payment of \$150 million over 10 years. According to the media, Gabon is the first African country to receive payments of this nature.</p> | 0                                                            |
| 3251 | Anonymous            | TE                  |                 | <p>General guidance aligned with response 10: We agree that 'It is unrealistic, for example, to expect compensation mechanisms to be maintained in perpetuity'. However, the proposed durations of compensation risk are not explained and risk being excessive and counterproductive. The danger is that where there is too great a burden it is either not taken on in the first place or not taken seriously. The impact on viable NBS projects particularly smaller ones, is that they do not develop at scale and hinder vital near term carbon mitigation. The approach should be modified.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Reconsider as at risk being excessive and counterproductive. |
| 3251 | Anonymous            | GE                  |                 | <p>Yes, that would be good, both reductions/removals and tech-/nature-based. We also very much welcome that the AF has included an attribute indicating whether the underlying mitigation activity of the credit has contributed positively to sustainable development.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 0                                                            |
| 3251 | Gold Standard        | Table 1, i)         |                 | <p>This is critical to ensure the robustness of governance and should be part of the initial threshold.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Should be included in the initial threshold                  |

| 3251 | Individual/employee, Carbonext | Criterion 8.4: Consideration of legal requirements |                 | <p>Overall, we support the Core Carbon Principles. However, we would like to say that the criteria and requirements established in the Assessment Framework can significantly harm the market. The monitoring and verification systems needed to meet the principles are costly and not easily implemented, which in turn would slow down the voluntary market. This downturn goes against the urgent need to accelerate climate actions. We strongly believe ICVCM should consider reassessing the proposed principles and take into account other serious programs, frameworks and initiatives that are doing a significant and feasible work, such as CORSIA and ICROA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Although we support the importance of considering a robust legal requirements assessment for additionality, some other aspects may be taken into account in the process. However, it is greatly important to be made clear throughout the consultation document that mitigation activities can be considered additional even when there are legal requirements for preservation, but they are not enforced. It is definitely not clear enough in the document. The tropical forest areas in the Brazilian Amazon are legally under the Brazilian Forest Code, a legislation that requires that each rural properties maintain 80% of its area as native forest intact, i.e., according to the regulation only 20% of the property could be deforested. Though, this scenario is completely far from what is observed in the Brazilian Amazon region. According to the latest MapBiomass study [1], over 40% of the deforestation happens in private owned areas, and 99% of all deforestation detected in the Brazilian Amazon Biome has a degree of illegality. In some region, inside the biome, studies were able to show that over 92% of the deforestation goes beyond the 20% allowed, therefore the legally preserved area also suffers clear cut [2]. Although there is high illegality rate, it is not commonly observed any punishment or penalty for the many who deforest over the legally permitted area. According to the MapBiomass 2021 report [4], only 1.2% of the illegal deforestation alerts raised in 2020 resulted in infraction notices. The overall conclusion demonstrates that the common practice observed in the Amazon region is the non-compliance with the regulatory framework defined by the Brazilian Forest Code, combined with absent enforcement practices. Therefore, if the CCP do not reassess this aspect, it will make the forest carbon crediting impracticable and avoid the development of effective projects that are (and will be) working to change this huge tropical degradation reality. We strongly ask ICVCM to consider areas with low legal enforcement scenarios eligible for CCP credits, or the loss of native vegetation in Amazon Forest (and others) will likely continuously increase. In summary, if mitigation activities required by legal requirements are not considered additional (even if those legal requirements are not enforced), no carbon finance can be used to counter these trends, and vast areas of native vegetation with high carbon stocks will continue to be at risk of deforestation. | 3251 | Anonymous                      | 0                                                  |                 | <p>Relating to Gabon. In addition, Gabon has just adopted a new progressive law on climate change and this law establishes a solid framework for participation in carbon markets. It establishes the institutional frameworks necessary for Gabon to be able to sell carbon credits on international markets.</p> <p>Thus, this law which was adopted on September 13, 2021 by the Council of Ministers introduces structured mechanisms to measure and reduce emissions at national and sectoral levels. It sets up a national system of greenhouse gas (GHG) emission quotas that will be accurately measured, reported and verified, and helps to establish a carbon offset system and a carbon credit market. It also guarantees the full protection of forests with high ecological value and high carbon concentration while setting a ceiling of 15,000 hectares per year for the exploitation of natural forests.</p> <p>According to the provisions of the law, a new regulator, the Organisme de Gestion des Jeux Climatiques will oversee the development of a greenhouse gas emissions plan, including a national emissions cap that will be gradually reduced to reflect the contribution of the Gabonese Republic determined at the national level within the framework of the Paris Agreement. The law also puts in place the necessary framework for Gabon to be able to sell internationally transferred mitigation results under Article 6 of the Paris Agreement.</p> <p>Gabon is probably the most carbon-positive nation on the planet, with a net absorption of 100 million tons of CO2 every year, thanks to its protected and well-managed forests. The Climate Issues Management Organization will also develop and approve methodologies for reducing greenhouse gas emissions that will be applied in Gabon.</p> <p>In addition, the sustainable development plan which integrates agriculture, sustainable forestry, ecotourism and infrastructure development ensures that one third of the landscape will be officially set aside for the protection of biodiversity.</p> | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 3252 | Anonymous                      | TE                                                                 |                 | The IC-VCM approach takes account of historic NBS methodologies that purport to equate to a tonne of carbon removed and where compensation for reversals against that unit can be justified. However, in our view other approaches where the risk of reversal is quantified and robustly addressed at the point of credit issuance can remove or significantly reduce the requirement for compensation for reversals. The IC-VCM aims to unlock urgently needed additional finance and channel it efficiently towards the most impactful, cost-effective climate mitigation activities globally at speed and scale. To achieve this an understanding of the value of impermanent credits is crucial. This is distinct from reversal risk. We think that the better way forward is to compare the social value of mitigation of one credit with another and to invest accordingly. When done appropriately there is no or little need for compensation for reversals. The approach should take account of this. | Guidance for change in approach: In our view other approaches where the risk of reversal is quantified and robustly addressed at the point of credit issuance can remove or significantly reduce the requirement for compensation for reversals.                                                                                                                         |
| 3252 | Anonymous                      | GE                                                                 |                 | If so, at what level should types be differentiated (e.g., reductions vs removals, tech-based vs nature-based)?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                                        |

| 3252 | Gold Standard                  | Table 2, a)                                                        |                 | Following requirements are not practical to address as stated<br>- transition towards net-zero emissions; This shall by default be the goal for Paris Agreement (PA). However, this concept is evolving and procedures for effective implementation at activity level are to be established. A generic statement doesn't add any value.<br>- benefit-sharing arrangements; EP should clarify for which activity type it is required or should be made mandatory – considering that it is not relevant or practical to implement for all activities.                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Should be excluded from initial threshold and could be included in full threshold requirements with further clarity. Refer to the comments on specific requirements in later sections as well.                                                                                                                                                                           |
| 3252 | Anonymous                      | 0                                                                  |                 | The proposals suggested by IC-VCM are welcomed. However, item Table 50 b) needs more careful wording. It is practically impossible to evaluate whether a resource is efficiently used. The criteria should be "sustainable use" of a resource, such as biomass. In order to make such a criteria workable, the IC-VCM should have a green list of legal regimes which are considered to represent a sustainable management of biomass. In the first release, it is suggested that at least the EU RED directive is included on such a list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                                                                                                                                                                                                                                                                                                                                        |
| 3252 | Individual/employee, Carbonext | Criterion 8.7: Demonstration of new or enhanced mitigation actions |                 | Overall, the criteria laid out in the Assessment Framework is more ambitious than most standards available today. It could be more interesting to introduce threshold requirements that reflect practices achievable in developing countries today, as JREDD programs today are nascent and have undergone extensive consultation processes to determine local inclusion and quality assurance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | It is important to highlight that project-based credits that have being developed since before J-REDD implementation should be considered as eligible CCP credits. The nesting process may not be efficient or viable enough to incorporate all project-based credits that are being properly generated in the area before the jurisdictional operationally takes place. |

| 3252 | Anonymous            | Criterion 7.6       |                 | <p>Information on the Indigenous Peoples of Gabon</p> <p>On the legal level</p> <p>Gabonese legislation does not recognize the concept of “indigenous peoples” but some texts provide for the concept of “local communities” or “village communities” which benefit from customary rights, particularly in land and forestry.</p> <p>Thus, the Constitution of the Gabonese Republic provides the following- Article 2: recognizes "the equality of all citizens before the law, without distinction</p> <ul style="list-style-type: none"> <li>- The use of trees as construction wood and of dead wood or</li> <li>- Article 6: In registered productive state forests subject to a management plan, the exercise of customary rights of use is based on the allocation of land provided for in the management plan with a view to guarantee the sustainability and sedentarization of agricultural activity.</li> <li>- Article 2: The customary rights of use relate to: and in registered productive forests.</li> </ul> <p>The following map shows the localization areas of sensitive local peoples (Pygmies) in Gabon. specifies that :</p> <ul style="list-style-type: none"> <li>- Article 5: With the exception of the collection of dead wood lying on the ground and subject to the specific authorizations provided for by the texts in force, the exercise of customary rights of use are regulated in classified state forests Location of the Pygmy populations in Gabon In Gabon, the pygmies represent the following ethnolinguistic groups: Baka, Akoa, Barimba, Bakoya, Bakouyi and Babongo. Considered as the first peoples of Gabon and originating from the forest, they know the fauna and flora better.</li> <li>• Decree No. 692/PR/MEFEPEPN setting the conditions for the exercise of customary rights of use in the area of forest, wildlife, hunting and fishing customary” .</li> <li>- Rights of passage and use of water.</li> <li>• Article 3 clarifies that “in the sense of the concept of community forestry, a village community means a community of residence composed of men, women and children bound by norms and values accepted by all, living close to the forest where it exercises its right of customary and economic use”.</li> <li>- Article 14: Recognizes that these communities enjoy “rights of use</li> <li>- Grazing in clearings and the use of branches and leaves for fodder;</li> </ul> <p>Allocation and Management of Community Forests:</p> <p>The initial and full phases’ option 1 and 2 duration requirements are proposed without sufficient justification. This is also the case with the 100-year commitment equivalence implied criteria. Further rationale is required. If these specific durations are warranted by the 100-year GWP values from the 5th IPCC assessment report or the common time frames for NDCs under the Paris Agreement that should have been clearly set out.</p> | 0                                                     |
| 3253 | Anonymous            | TE                  |                 | <p>In short, yes, if companies or countries intend to make any claims around emissions in relation to reporting. No, if the company or country is showing good will – which is also important. Importantly in the latter case where there is no CA there cannot be any claims made in relation to GHG emission reduction and the outcomes of these actions cannot be used in any climate reporting. On the other hand, the projects can be described as support and good will.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Further rationale is required and/or reconsideration. |
| 3253 | Anonymous            | TE/GE               |                 | <p>To elaborate more, we see that the AF refers to the Paris Agreement and the Article 6, which we welcome. In the next phase of operation, we suggest that the AF further elaborate – and take a clearer stance – on the connection to Article 6 and its potential impact on the voluntary market, especially by exploring the relationship to CA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                     |
| 3253 | Anonymous            | TE/GE               |                 | <p>Our opinion is that it is important that the voluntary carbon market finds a way to relate to international cooperation under the Paris agreement through Article 6 in a meaningful way, since Article 6 is also about mobilizing private finance. In terms of the private sectors contributions, initiatives such as SBT-i allow companies to, much like the countries they work in, align to the same goal: limiting global warming to 1.5 degrees. This mainly means mitigation within the value chain of a given company. Yearly achievements of this can then be reported in corporate sustainability reporting. The space we mainly see for VCM in this new context from the point of view of companies is mainly mitigation beyond the value chain (although this is yet to be confirmed by the likes of SBT-i).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 0                                                     |

| 3253 | Anonymous            | TE/GE               |                 | Claims around mitigation beyond the value chain might be difficult to manage with high environmental integrity without including the mechanisms catered for in Article 6 of the Paris Agreement, i.e. the transfer of MOs (Mitigation Outcomes) into Internationally Transferred Mitigation Outcomes (ITMOs) and the required CA between the host country (where the activity is done) and, if necessary, the acquiring country (presumably the country where the company is making the offset claim).                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                      |
| 3253 | Anonymous            | TE/GE               |                 | As you discuss in the AF, “Some view the Paris Agreement and company accounting systems as operating in parallel while others consider these systems inherently connected”. XXXX would argue that the systems indeed are inherently connected, and that a CA is crucial to avoid double claiming whenever MOs are transferred internationally.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0                                                                                                                      |
| 3253 | Anonymous            | TE/GE               |                 | Therefore, when it comes to making corporate claims in relation to the net-zero standard, for example addressing historic emissions or going into negative emissions, there must be a CA of any emission reduction purchased. Under 6.2 we understand that the CA will occur on both sides (host country and acquiring country). This emission reduction should ideally then be cancelled, allowing the company who paid for the emission reduction to make claims around mitigation. With that cancellation, it would also enable the selling and buying between companies of this “OMGE-unit” across borders. Note that a CA can only occur through an Article 6 collaboration in order to secure that there is no double counting. Under 6.4 where a CA is, as we understand it, if only required at the host country side, this would have the same effect of OMGE, if a private entity is a buyer.                                          | 0                                                                                                                      |
| 3253 | Anonymous            | TE/GE               |                 | XXXX is working to turn Article 6 into practice through bilateral agreements and mitigation outcome purchase agreements that are intended to set best practice on how to purchase ITMOs (Internationally Transferred Mitigation Outcomes). An ongoing discussion for us is the role of the private sector in Article 6 – here we see many synergies with the work being done on the AF. We would be very interested to discuss how the authors visualise the relationship between Article 6 and the voluntary carbon market.                                                                                                                                                                                                                                                                                                                                                                                                                     | 0                                                                                                                      |
| 3253 | Anonymous            | TE/GE               |                 | Finally, it might be worthwhile keeping in mind that double claiming can also be connected to other claims around the activity, such as those connected to sustainability. We are not sure if there is a place for this in the document now, but potentially in future versions?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                      |
| 3253 | Gold Standard        | Table 2, a)         |                 | As included in PA, this requirement is critical for robust and transparent governance system                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Should be included in the initial threshold. Refer to the comments on specific requirements in later sections as well. |
| 3253 | Anonymous            | 0                   |                 | The possibility to include attributes could increase the transparency of the mitigation activity, depending on the level of information in the certificate.<br>Regarding the label Type of mitigation activity, it is essential that it is made clear whether the mitigation activity is a reduction, avoidance (fossil CCS) or a removal as well as the duration of the removal. It is not whether a removal is considered nature-based, biological or technological that is important. It is primarily the duration of the storage that is the differentiating and important factor. Regarding the label Authorization for Article 6 purposes, this is not the critical question. The critical question, whether it is Authorized or not under Article 6, is whether the mitigation outcome “may contribute to a national climate objective”, which in itself is not a integrity/quality criteria but part of the full transparency principle. | 0                                                                                                                      |

| 3253 | Individual/employee, Carbonext | Criterion 13.3:<br>Addressing double claiming of mitigation outcomes with host country NDCs |                 | Concerning the Host Country Authorization Criterion, we believe that no corresponding adjustments should be included regarding the VCM. Requiring authorization from a host country would prevent them from achieving their own NDCs, as the corresponding adjustments would require a deduction from the national records in each instance. Considering that nowadays most of the VCM credits come from developing countries, the idea of requiring corresponding adjustments would go against the sustainable development proposal and the principles of common but differentiated responsibilities, principles enshrined in the UNFCCC. We believe that corporate claims do not constitute double claiming under Paris Agreement, since corporates are non-state actors and therefore not part of the agreement. The emission reductions created by a host country voluntary project do not need to be reflected in any national accounts: the seller's credits are not debited from the host country's account, and not added to the national account of the buyer. Creating an additional requirement under uncertain future policy decisions further complicates market transactions. Demanding this authorization can become an obstacle to VCM, slowing down transactions. Considering the important need to reach net zero by mid-century and reduce emission by half by 2030, we should consider not creating new barriers to entry to the market at a time when we are facing an impending supply shortage. It is important to assure credit quality without creating restrictions that could jeopardize, the so much needed, investments in climate action. When a robust accounting architecture under Article 6 is well implemented by all parties involved, a new model of voluntary and compliance accounting systems may be discussed. | Some institutions, concerned with the subject, are proposing labels that allow converting a credit generated in the voluntary market to the regulated market (NDC- national determined contributions), if it is requested. It would be valid to consider these approaches to analyze the applicability of these credits to CCP eligibility criteria. In this scenario, it is important to ensure that there is no double counting, but requiring authorization from the country host may not be the better option to this goal.                                                                                                                                                                                                                                                                                                                                                |
| 3253 | Anonymous                      | 0                                                                                           |                 | Terms to add :<br>Consent Prior, free and informed.<br>The Declaration on the Rights of Indigenous Peoples requires States to consult and cooperate in good faith with the indigenous peoples concerned – through their representative institutions – before adopting and implementing legislative or administrative measures that could concern them in order to obtain their prior, free and informed consent.<br>Consultation and participation are essential elements of a consent process.<br>What exactly does “free, prior and informed” consent mean?<br>“Free” implies the absence of coercion, intimidation or manipulation. “Prior” implies that consent is obtained sufficiently in advance of any authorization or start of activity and that the time limits necessary for the Aboriginal consultation and consensus-building processes are respected.<br>“Informed” implies that the information provided covers a range of aspects, including the nature, scale, pace, reversibility and scope of any proposed project or activity; the objective of the project as well as its duration; the location of the areas concerned; a preliminary assessment of potential economic, social, cultural and environmental impacts, including potential risks; personnel likely to be involved in the execution of the project; the procedures that the project may involve.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | States must engage in consultations to obtain consent to take any of the following actions: the adoption of legislative or administrative measures concerning indigenous peoples (Article 19); carrying out projects that affect the rights of indigenous peoples to their lands, territories and resources, including mining and other uses or exploitation of resources (Article 32); resettlement of indigenous peoples forced to leave their lands or territories (Article 10); the storage or unloading of hazardous materials on the lands or territories of indigenous peoples (article 29); in addition, indigenous peoples who have involuntarily lost possession of their lands, when these have been confiscated, taken, occupied or degraded without their free, prior and informed consent are entitled to restitution or other appropriate redress (article 28). |
| 3254 | Anonymous                      | GE/TE                                                                                       |                 | The doubling of requirement in the final phase also appears arbitrary and is a huge change compared to the prior IC-VCM approaches. It is likely to reduce and potentially end the supply of conventional NBS credits. The approach should be reconsidered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The approach should be reconsidered with a less long duration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 3254 | Individual/employee, Carbonext | Criterion 9.3:<br>Temporary crediting approaches                      |                 | Based on the similarity of the Clean Development Mechanism (CDM) temporary certified emissions reduction and the approaches presented to temporary crediting on the AF, we do not believe that it is an efficient and interesting measure to be encouraged. Temporary credits under the CDM were not well received by buyers, as they created an open-ended obligation to replace the temporary credit when it expired a decade or more. Even the most willing and ambitious user of such a credit were not ready to manage this risk. It would not be interesting to re-foment in the carbon market a concept that had already proven to be unworkable                                                                                                                  | It would be more interesting to seek solutions that address permanence through enhanced existing mechanisms (i.e., buffer pools), and an understanding of associated claims that can be made with these credit types.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Each United Nations System Agency has its own definition of what _ term .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | It is based on three criteria fundamentals :<br>•Continuity feature history _ that :<br>occupation ancestral Where of at less a part of the land current ;<br>the common ancestry with the first occupants of these land ;<br>culture in general Where some of his demonstrations;<br>language ;<br>establishment in certain parts of the country or in certain regions of the world;<br>others factors relevant .<br>•Self-identification as a native ;<br>For an individual , belonging to a group indigenous , claimed by both the individual and the group to which he belongs .<br><br>Jose Martinez Cobo states that:<br>"By indigenous communities, populations and nations, we mean those which, linked by historical continuity with the societies prior to the invasion and with the pre-colonial societies which developed on their territories, consider themselves distinct from the other segments of the societies which now dominate their territories or parts of these territories. They now constitute non-dominant segments of society and they are determined to preserve, develop and transmit to future generations their ancestral territories and their ethnic identity, which constitute the basis of the continuity of their existence as peoples, in accordance with their own cultural models, their social institutions and their legal systems. » |
| 3255 | Anonymous                      | TE/ED                                                                 |                 | The initial and full phases' option 2 example of 1% crediting is a highly conservative case study and lacks sufficient explanation and may serve to deter robust, appropriately conservative methodologies. Leading examples should not be so conservative.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Replace example with a less conservative example.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 3255 | Anonymous                      | GE/TE                                                                 |                 | Ideally, as mentioned above, all carbon credits connected to voluntary claims should be cancelled. That way, not only would it allow the company who paid for the emission reduction to make claims around mitigation, the emission reduction would constitute a contribution to overall mitigation of global emissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 3255 | Gold Standard                  | Table 4, a)                                                           |                 | GS welcomes the requirements and agree with the intention to have public disclosure of source of funding. However, it is not being practiced widely across the Programme. The initial threshold may have a requirement to have procedure in place rather as stated in current draft to allow Programme established a procedure with clear scope on what is to be included in the reporting. Also, requirement shall clearly outline the scope excluding the usual operation related fee applicable to other certification activities beyond registration and issuance for example methodology review and approvals.                                                                                                                                                      | Should be included in full threshold with further clarity on scope as suggested in the comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3255 | Anonymous                      | 0                                                                     |                 | Option 2 is preferred, i.e. no provision on this matter, since a credit program should be assessed based on its additionality. The notion of OMGE may get entangled in the double claiming debate and could limit the acceptability of the IC-VCM principles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 3255 | Individual/employee, Carbonext | Criterion 8.7:<br>Demonstration of new or enhanced mitigation actions |                 | Overall, the criteria laid out in the Assessment Framework is more ambitious than most standards available today. It could be more interesting to introduce threshold requirements that reflect practices achievable in developing countries today, as JREDD programs today are nascent and have undergone extensive consultation processes to determine local inclusion and quality assurance. It is important to highlight that project-based credits that have being developed since before J-REDD implementation should be considered as eligible CCP credits. The nesting process may not be efficient or viable enough to incorporate all project-based credits that are being properly generated in the area before the jurisdictional operationally takes place. | We support option 2 of not adding additional requirements for JREDD program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 3256 | Anonymous                      | TE                  |                 | While the provision in 9.2a Option 3 allows for alternative approaches, our concern is that the IC-VCM assessment outcome could be perceived to involve too high a degree of uncertainty and that the IC-VCM may only have resources to consider 9.2a Option 3 approaches in the medium/longer term. These factors will deter suppliers and investors alike from engaging with viable innovative approaches. The approach should be modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | The approach should be reconsidered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 3256 | Anonymous                      | 0                   |                 | Option 2 is preferred, i.e. no provision on this matter. It is essential that the principles of the IC-VCM does not imply that an authorized project (with CA) is of better integrity/quality than an unauthorized project (with CA). This does not preclude that such information is part of the public information available about the project. If this is not achievable in general, special provisions should be made for negative emissions with geological storage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 3256 | Individual/employee, Carbonext | 0                   |                 | <p>Although we support the importance of considering a robust legal requirements assessment for additionality, some other aspects may be taken into account in the process. However, it is greatly important to be made clear throughout the consultation document that mitigation activities can be considered additional even when there are legal requirements for preservation, but they are not enforced. It is definitely not clear enough in the document. The tropical forest areas in the Brazilian Amazon are legally under the Brazilian Forest Code, a legislation that requires that each rural properties maintain 80% of its area as native forest intact, i.e., according to the regulation only 20% of the property could be deforested. Though, this scenario is completely far from what is observed in the Brazilian Amazon region. According to the latest MapBiomass study[1], over 40% of the deforestation happens in private owned areas, and 99% of all deforestation detected in the Brazilian Amazon Biome has a degree of illegality. In some region, inside the biome, studies were able to show that over 92% of the deforestation goes beyond the 20% allowed, therefore the legally preserved area also suffers clear cut[2]. Although there is high illegality rate, it is not commonly observed any punishment or penalty for the many who deforest over the legally permitted area. According to the MapBiomass 2021 report&lt;sup&gt;4&lt;/sup&gt;, only 1.2% of the illegal deforestation alerts raised in 2020 resulted in infraction notices. The overall conclusion demonstrates that the common practice observed in the Amazon region is the non-compliance with the regulatory framework defined by the Brazilian Forest Code, combined with absent enforcement practices. Therefore, if the CCP do not reassess this aspect, it will make the forest carbon crediting impracticable and avoid the development of effective projects that are (and will be) working to change this huge tropical degradation reality. We strongly ask ICVCM to consider areas with low legal enforcement scenarios eligible for CCP credits, or the loss of native vegetation in Amazon Forest (and others) will likely continuously increase. In summary, if mitigation activities required by legal requirements are not considered additional (even if those legal requirements are not enforced), no carbon finance can be used to counter these trends, and vast areas of native vegetation with high carbon stocks will continue to be at risk of deforestation.</p> <p>[1] <a href="https://s3.amazonaws.com/alerta.mapbiomas.org/rad2021/RAD2021_Completo_FINAL_Rev1.pdf">https://s3.amazonaws.com/alerta.mapbiomas.org/rad2021/RAD2021_Completo_FINAL_Rev1.pdf</a><br/> [2] <a href="https://www.icv.org.br/wp-content/uploads/2020/06/br-icv-brief4pt.pdf">https://www.icv.org.br/wp-content/uploads/2020/06/br-icv-brief4pt.pdf</a></p> | A assessment of reliable data and information should be requested that demonstrate that in the place in question, despite the legal obligation, deforestation and degradation of the area is common practice, the business as usual.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

The latter aimed to define , for each industrialized nation , limits strict of greenhouse gas emissions , and the establishment of a mechanism facilitating the reporting , trading and monitoring of emission rights . At the center, a regulatory body ( in this case , the United Nations ) which issues quotas.</p> <p>Since then , any reduction project leader _ or sequestration _ of greenhouse gas emissions , can ___ receive " credits " carbon " provided that certain conditions are met . A credit carbon works as a certificate attesting that the said project avoided _ Where held captive a ton of carbon dioxide _ equivalent (tCO2e).</p> |
| 3257 | Anonymous                      | ED                  |                 | We suggest qualifying the description statement that 'If the carbon-crediting program uses monitoring and compensation to manage reversal risk, it shall have in place appropriately robust measures to compensate for any reversals that occur'. In line with our other comments including item 12 in this response table approaches where the risk of reversal is quantified and robustly addressed at the point of issue of the credits should not require compensation to the buyer for reversals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Replace sentence with 'If the carbon-crediting program uses monitoring and compensation to manage reversal risk, it shall have in place appropriately robust measures for reversals'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 3257 | Anonymous            | GE/ED                                |                 | As mentioned already as a response to another question, for XXXX, it is of great importance that the carbon credits issued for voluntary use is of high quality. This includes contributing to sustainable development. Ideally, it should therefore be enough to include only the one full stringency threshold for private companies to consider when they wish to mitigate emissions beyond their value chain, however we are also aware that it is important to stimulate the flow of funding to raising climate ambition in relation to the Paris agreement.                                                                                                                                                                                                                                                                                                                                                                                | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3257 | Anonymous            | GE/ED                                |                 | We also think that the AF could be more vocal regarding traceability/attribution, which is critical to ensure transparency, third-party control, and the quality of the emission reductions. As of now, there is only one mention of traceability in the AF on page 66:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 3257 | Gold Standard        | Table 5, a)                          |                 | The requirement is too broad and doesn't clearly outline which aspects are to be considered. Further requirements address this requirement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Should be removed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3257 | Anonymous            | Para 2                               |                 | The possibility to include attributes could increase the transparency of the mitigation activity, depending on the level of information in the certificate.<br>Regarding the label Type of mitigation activity, it is essential that it is made clear whether the mitigation activity is a reduction, avoidance (fossil CCS) or a removal as well as the duration of the removal. It is not whether a removal is considered nature-based, biological or technological that is important. It is primarily the duration of the storage that is the differentiating and important factor. Regarding the label Authorization for Article 6 purposes, this is not the critical question. The critical question, whether it is Authorized or not under Article 6, is whether the mitigation outcome "may contribute to a national climate objective", which in itself is not a integrity/quality criteria but part of the full transparency principle. | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 3261 | Emma van de Ven      | 0                   |                 | Description of impact needs a metric                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | These impacts need a quantifiable approach where they can be measured. Reference to any sustainable impact measurement protocol is better than unclear wording that can't be verified.                                                                                                                                                                                                                                     |
| 3262 | Anonymous            | GE                  |                 | As there is a note that Table 46 remains 'under review' it would be appropriate that there be a further consultation on temporary crediting approaches once this review is complete.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | IC-VCM to assess feedback and consult on temporary crediting approaches once this review is complete.                                                                                                                                                                                                                                                                                                                      |
| 3262 | Gold Standard        | Table 6, h)         |                 | Key requirement and should be included in initial threshold                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Should be included in initial threshold                                                                                                                                                                                                                                                                                                                                                                                    |
| 3262 | Emma van de Ven      | Table 11            |                 | The validation approach isn't finalised before the first credits are issued. Key things to validate ; verify are for example payments to local communities, validation of ex post removals or SDG impacts. There should be a realistic approach to validating projects that can encompass all key project proponents, without it being mandatory before the first credits are issued, simply because most things can't be validated before the start of the project.                                                                                                                                                                                                                                                                                                           | See above                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3263 | Anonymous            | ED                  |                 | Table 47 initial phase a) 1) and 2) requirements for plans do not address the danger that such plans could be of variable quality, currency, and reliability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Consider value of these requirements.                                                                                                                                                                                                                                                                                                                                                                                      |
| 3263 | Gold Standard        | Table 7, e)         |                 | This is not feasible to ensure the receipt of grievance by the independent committee. The Programme should be able to facilitate the grievance procedure via its governance system. We suggest EP to have a look at the Gold Standard's grievance resolution designed following the best practices approaches, available here <a href="https://globalgoals.goldstandard.org/000-8-gov-grievance-approval-procedure/">https://globalgoals.goldstandard.org/000-8-gov-grievance-approval-procedure/</a>                                                                                                                                                                                                                                                                          | Should be refined further considering the practicality aspect for efficient implementation                                                                                                                                                                                                                                                                                                                                 |
| 3263 | Emma van de Ven      | Table 24            |                 | A registry alone can't prevent these risks, because most of the double claiming risks stem from inconsistent carbon accounting. The example of supply chain accounting that incorporates carbon farming interventions that were monetised on the VCM illustrates how registry transparency doesn't allow for a 1-on-1 comparison between a VCM credit and the carbon inventory associated with the produce generated on that land.                                                                                                                                                                                                                                                                                                                                             | Refer back to the lowest common denominator of the GPS polygons of the farm land as a starting point. Communicate with the GHG protocol or any other supply chain accounting body on how to prevent this double claiming                                                                                                                                                                                                   |
| 3264 | Anonymous            | ED                  |                 | Table 47 initial phase b) requirement proposes that a programme be continuously operational for two years. This is an arbitrary duration and may hinder new entrants and competition. Such a requirement should be removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Remove requirement.                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3264 | Gold Standard        | Table 8             |                 | -                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Gold Standard recommends clear expectations and procedures are set out for when and how corrective action by the scheme for over-issuance occurs. This does not always mean the scheme must itself cancel credits, for example, but the scheme should ultimately be responsible for ensuring over-issuance is dealt with. To our knowledge Gold Standard is the only market participant to have taken such action to date. |
| 3264 | Emma van de Ven      | Table 36            |                 | Benefit sharing shouldn't be the share of the profit of the carbon credit sales, but a transparent cost analysis including the shares taken by project developers. Benefit shares should be a percentage of the revenue, not the profit. This transparency will prevent excessive costs charged by middle men ; project developers.                                                                                                                                                                                                                                                                                                                                                                                                                                            | See above                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 3266 | Gold Standard             | Table 9                                                                                         |                 | The Programme with other requirements outlined in AF ensures the transparency and accountability across its functions and governance system. The requirement is not practical and would add unnecessary administrative burden.                                                                                                                                                                                                                                                                                                                                                              | Should be removed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3266 | Anonymous                 | 0                                                                                               |                 | Many offset projects, such as natural climate solutions, can provide benefits beyond GHG reductions. At the same time, co-benefits can create additional confusion and complexity around the measurement or classification of project attributes that can be subjective. Additionally, requirements that track, monitor and verify these co-benefits can make the broader adoption of the CCP ;s more difficult for existing standards and market participants.                                                                                                                             | n/a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 3268 | Gold Standard             | Table 10, f)                                                                                    |                 | The frequency of methodology review and update shall be reduced to three years.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Requirement should be revisited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3268 | Anonymous                 | 0                                                                                               |                 | According to CMA decisions, corresponding adjustments shall be applied for cooperative approaches under Article 6.2, either for ITMOs used towards NDCs (covered or not by the host country ;s NDC) or for other international purposes. Also, for A6.4ERs for use towards the achievement of NDCs or for other international purposes, Parties shall apply a corresponding adjustment. Overall, for global accounting and stocktaking to make sense, it is essential that all international transfers are registered and accounted for by national governments, including those in the VCM | We propose that all CCP-approved credits are correspondingly adjusted. An exception would be international corporations not associated with a particular country, as their emissions may impact multiple NDCs. For international corporations, we propose that a corresponding adjustment is made on the seller ;s side and that the credit is canceled and retired by the buyer, to promote environmental integrity. Following Article 6.2 decisions in Glasgow, host countries should define a procedure to register and track all internationally transferred credits and to account for them annually. Without these adjustments, there is high risk of double-counting, resulting in a loss of integrity of the VCM and undermining countries ; NDCs                                                                                                                                                                                                                                                                                                                    |
| 3269 | Gold Standard             | Table 10, g)                                                                                    |                 | AF should clarify that the methodology suspension also includes application by registered project/Programme that has applied the given methodology and where overestimation is above x% threshold.<br>AF should also include clear requirements on how to treat issued credits that has already been issued applying a methodology.                                                                                                                                                                                                                                                         | Should be further clarified as suggested in the comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3269 | Anonymous                 | Criterion 7.5: Biodiversity conservation and sustainable management of living natural resources |                 | The Assessment Framework requires carbon-crediting programs to have guidance and procedures related to protecting and conserving biodiversity, preserving the benefits from ecosystem services, and promoting the sustainable management of ecosystems and living natural resources. Further, the requirements include avoiding impacts to biodiversity, avoiding the introduction of invasive species, and preferring a mix of native species.                                                                                                                                             | We believe these points to be appropriate but incomplete. Projects must not negatively impact biodiversity, they should conserve it and, where possible, increase it. Diversity of life should be increased from level of gene to the level of ecosystem (NBSI, 2021), and thus, projects should not aim to promote extensive monocultures. Diversity of life is promoted by projects when they cover a wide range of ecosystems &ndash;natural or semi-natural&ndash; and/or by creating novel ecosystems in and around cities or across the wider landscape (NBSI, 2021). For the land sector, including forests, VCM projects should always have quantitative effects on biodiversity (Seddon et al. 2021) &ndash;this will unlock the full potential of the VCM, evolving it from a carbon-crediting framework to a sustainable development mechanism, in line with the spirit of Article 6 and the Paris Agreement. Finally, for land-based projects, which must aim to increase biodiversity, a fair price of carbon includes these additional efforts and co-benefits |
| 3270 | Gold Standard             | Table 11                                                                                        |                 | EP should outline the accounting principle and technical guidance for methodologies to ensure the consistency and conservativeness across the methodologies and Programme. EP may consider refinement to Technical guidance on methodologies for adjustments under Article 5, paragraph 2, of the Kyoto Protocol or similar document including IPCC 2019 refinements.<br><a href="https://unfccc.int/cop9/latest/sbsta_10_add2b.pdf">https://unfccc.int/cop9/latest/sbsta_10_add2b.pdf</a>                                                                                                  | Should strive for setting the common accounting principle with technical guidance to ensure consistency and conservativeness. The EP is requested to consider the previous work developed under Kyoto protocol and latest IPCC 2019 guidelines. It will ensure consistency across the methodologies and with general accounting approaches across the programmes and reduce the need for reassessing each methodology as outlined in the credit type assessment section. The EP may review the methodology during the development or at anytime as needed to ensure the compliance with the guidance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3270 | John Holler               | Credit types                                                                                    |                 | Considering the unique scale of JREDD and its respective considerations for IPLC, accounting, permanence, leakage, and safeguards, we recommend: 1) ICVCM accomodate and adopt the guidance of the Tropical Forest Credit Integrity Guide throughout its framework (e.g., guidance on full and effective participation of IPLC). 2)That these criteria be tested against one or more existing JREDD standards before another round of public consultation.                                                                                                                                  | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 3271 | Gold Standard        | Table 11, a) & e)                    |                 | AF should clarify the GHGs that can be considered for carbon credit issuances. PA doesn't outline the eligible GHGs as was the case with Kyoto protocol.<br>AF should clarify if Short-lived climate pollutants such as black carbon may be included in the eligible list of GHGs for issuance of carbon credits considering the significant contribution of such pollutant. AF should clarify what time horizon should be applied for GWP for short lived climate pollutants.<br>AF should adopt the requirement outlined under e) with respect to GWP and time horizon for initial threshold to ensure the consistency across the Programme and to align with PA. | Should be revisited as per the comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 3277 | Anonymous            | Table 1                              |                 | There is a lot of focus on carbon crediting programs . It is important to point out that there are also smaller, yet robust independent GHG registries that accept projects and serialize offsets, based on ISO and other established standards *. These independent registries are capable of adhering to requirements of CCP and tagging qualified offsets appropriately on their public listing. The document addresses assessment for carbon credits at seemingly only a program ; level and offset level. However, there is no guidance for smaller registries on the type of review they need. We need to acknowledge the value of smaller registries, their capabilities, and provide them with CCP guidelines to allow them to keep bringing investment to the market, should they meet CCP. Every high integrity credit coming into the market helps get closer to IPCC goals; we need to enable ALL bodies to join the force and add their high integrity credits to the market. By limiting the review at program ; level and leaving behind other registries, we will have lost investment for carbon emission reductions and removals. The guideline seems to put aside small yet credible registries rather than providing guidelines for all to be able to meet the CCP requirements, which is contrary to scaling the market. The objective should be enabling more entities on joining the high integrity market rather than risking removing certain capable entities from the picture with a focus on the largest international programs . *Standards in the comment refers to a document that sets out minimum requirements. | Please consider modification of the approach as per above comment.                                                                                                                                                                                        |
| 3278 | Gold Standard        | Table 13                             |                 | AF should clarify the current edition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Current should be replaced with “latest” as at any given time there could be more than one version available.<br>Also it should be clarified if a new version is introduced should existing accreditation be valid or accreditation reapproval is needed. |
| 3278 | Anonymous            | Figure 0.1 – Please answer yes or no | Yes             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | n/a                                                                                                                                                                                                                                                       |
| 3279 | Gold Standard        | Table 17 b)                          |                 | As long as the Programme has provisions to ensure double issuance, it should be fine if the project is actively registered with other compliance Programme. For example – deregistration with CDM takes months to year and may cause risk of discontinuation for vulnerable project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Deregistration should not be mandatory conditions as long as double issuance is avoided with robust provisions.                                                                                                                                           |
| 3279 | Anonymous            | 0                                    |                 | There needs to be different additionality criteria based on the project type. For example, a commercial timber plantation that is registered under a carbon crediting scheme will require a different assesment of additionality (as the counterfactual is difficult to assess) when compared to a project type that is inherently additional (as there is no obvious commercial reason to implement a project beyond the negative emissions for certain rproject types e.g. DACCS)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Suggest having assessment criteria for additionality based on project type (e.g. DACS, ARR etc) rather than a generic ;one size fits all ; approach                                                                                                       |
| 3280 | Gold Standard        | Table 25, a) 2 &3                    |                 | AF should clarify what does “All” refer to. It should be final versions of the validation report. Assume it is not referring to all versions of validation/verification reports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Clarification is needed.                                                                                                                                                                                                                                  |

| 3281 | Anonymous            | 0                                    |                 | We wholeheartedly support the notion of carbon credits furthering sustainable development. Our organization recommends requiring a do-no harm approach along with the use of credible sustainable development impact standards (such as CCB, SD VISTa and Gold Standard) to demonstrate positive impacts. The concept of net positive sustainable development impacts requires further clarification as it may not be possible to adequately quantify and compare all impacts across 17 Sustainable Development Goals to calculate a net impact. We recommend that positive impacts on one or more SDG be labeled as an attribute. Defining appropriate safeguards for jurisdictional REDD+ activities has been a focus of UNFCCC work for two decades. The Cancun Safeguards are the result of a collaborative, international process that included supply countries as well as key stakeholders such as Indigenous Peoples. XXXX proposes that the Cancun Safeguards form the basis of assessment for JREDD programmes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | see above                                                                                                                                                                                                                                                 |
| 3282 | Gold Standard        | Table 25, a) 6                       |                 | The parameter level information is captured in design document, validation report, monitoring report and verification report and these documents are made publicly available. A search functions to parameter level check is not practically possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Should be removed as information is available in activity documents.                                                                                                                                                                                      |

| 3282 | Anonymous            | 0                   |                 | Double counting exists where unit a unit is used for both a domestic scheme like an ETS or carbon tax and an international VCM. However, an NDC is not compulsory mitigation scheme, but is a target that may not even specifically include the activity producing the ER. This should allow for a VCM project to contribute to the host country NDC, while still allowing a corporate to make appropriate claims.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | see above                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3283 | Gold Standard        | Table 25, a) 9      |                 | Requirement to create a non-technical summary document is not practical when the information is captured and reflected through different means and documents. For example Gold Standard registry project page captures the required information for non technical stakeholder while for details documents are available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Scope and mandatory requirements for information requested should be revisited to avoid administrative burden to accommodate all info in one document.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 3283 | Anonymous            | 0                   |                 | Net positive impact is absurd. One cannot net the +/- impacts across, for example, human health and education. These are separate issues.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | IC-VCM should require do no harm provision with respect to the SDGs, while also allowing demonstration of positive impact (or requiring a minimum, e.g., 3) on SDGs, using available 3rd party frameworks to verify impact (e.g., CCB, SD VISTA or Gold Standard).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3284 | Gold Standard        | Table 25, c)        |                 | The info requested under each of the option, for example option 1a – median price to be made public is not feasible and practical considering that it is outside the scope of certification. Similar other options are requiring information that would not be available at the time of certification for a given period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Should be removed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3284 | Anonymous            | Description         |                 | This is vague. See example of REDD projects that are the only funding stream for a national park (the national park is legal protection, but without funding it can't be protected). Not all activities have a time-bound phase in of legal requirements. There must be some statute of limitations here. If a project is implemented in y1 when no requirements exist, and a law is passed in y3, the project must have at least the remainder of the crediting period to continue. Otherwise, there is a huge risk to investment; and potential for lobbying against policy that would impact activities. No will invest in something that may be negligible in an unknown number of years.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The requirement for limited time should be replaced with a means to justify the activity is not implemented or enforced. Do not require re-assessment of additionality at every verification or issuance. Base this rather on the crediting period renewal (or, e.g., every 5 years, at minimum).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3285 | Gold Standard        | Para 4              |                 | The compliance with IFC as minimum standard would increase the scope of assessment and thus will be too wide.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The scope should be limited to the requirements outlined in AF or program's own standard requirement to have clear set of requirements for project developer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3285 | Anonymous            | Description         |                 | the generation of carbon credits by the crediting program under which the mitigation activity is seeking to register... This is far too specific... if a project initially lists under one standard but moves to another, this would be violated, but would have no bearing on prior consideration (any consideration of carbon finance is applicable to any program).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Remove specification by standard. Or better yet, remove this entire overly-detailed approach to additionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 3286 | Gold Standard        | Table 27, a)        |                 | Comprehensive and written guidance from Programme is not always needed as third party best practices guidance can be referred without duplicating such info. For example IFC principles comes with associated guidance. To avoid duplication, the mandatory requirements to have written guidance can be avoided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Should be revisited as per the comments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3286 | Anonymous            | Table 42            |                 | Evidence of prior consideration and the start date are two very different things. This conflates them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Separate requirements for prior consideration and start date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3287 | Gold Standard        | Table 27, h) and i) |                 | Considering the scale and project boundary of the activities, requiring workers to monitor the workers employed by third parties and supply chain is practically not feasible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Should reconsider the scope of the requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3287 | Anonymous            | Table 45            |                 | This is far too detailed and off the mark, especially for projects in developing countries. For example, the full threshold requirement for the treatment of avoidable reversals, obligating the carbon-crediting programme to require proponents to sign legal agreements obligating them to monitor, report and compensate for avoidable reversals for the full commitment period, will be too difficult to implement in many countries, as it will be impossible (and expensive) to legally chase many entities to compensate. If the carbon programme assures proper management of permanence, there is no reason for the IC-VCM to implement such specific requirements. There are existing buffer design approaches that are tried, tested, and credible. When it comes to NCS specifically, it is not always clear whether reversals are avoidable or unavoidable &ndash; while carbon losses to natural disturbances can easily be distinguished as unavoidable, there can sometimes be a blurring (i.e., a controlled fire for a specific reason by a landowner that then gets out of control). Differentiating between avoidable and unavoidable reversals at a jurisdictional level can also be difficult. | IC-VCM should focus on program governance of the permanence approaches applied, not set detailed requirements. This should require: 1) Clear definitions of the minimum length of time (for the activity), the length of time assessed (e.g., risk projected over what timeline based on what timeline of historical data, where relevant); and the length of time monitored (e.g., a project may be 30 years, but the standard may monitor for 100) 2) A transparent mechanism for managing permanence risk (e.g., buffers, insurance or (high quality) tonne-year accounting (e.g., with a minimum perm period)) 3) Regular 3rd party assessments of the approach used to ensure it is robust and sufficient (noting that this would be a future/full requirement as it isn't currently done by 3rd parties or may not be done across all standards yet) 4) A means of ensuring the long-term health of the permanence approach, even if the standard were to cease to exist (e.g., re-insurance; and/or having the buffer in a trust should the entity be folded) |
| 3288 | Gold Standard        | Table 28 b)         |                 | Imposing legal and regulatory procedure is not practically feasible and may lead to unnecessary legal burden.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Should be guidance as purpose is to promote the efficient and sustainable use. Legal and regulatory requirement is not feasible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 3288 | Anonymous            | Criterion 9.4: Institutional sustainability                                              |                 | Less than half a percent of U.S. businesses have survived 100 years. Setting that expectation for carbon programmes, when it has not been done by any other businesses, seems extraordinary, and unnecessarily punitive. However, other mechanisms, as noted above could be used, eg., re-insurance of the buffer pool; and/or programs establishing what would happen the event they cease to exist with permanence obligations still on the books (such as putting the buffer in a trust). Noting also that 100 years from now, we will either have solved the climate crisis (e.g., new fuel sources and direct air capture or other removals) or be in a much worse state. Either way, it is a bit ridiculous to think we will still be reliant on carbon crediting programs at that point. Most permanence issues should have been devolved to national actors and regulatory regimes by then. | Focus on governance and long-term planning (as noted above), not requiring carbon programs to prove they can exist for 100 years.                                                                                                                                                                        |
| 3289 | Gold Standard        | Table 32 g)                                                                              |                 | The requirement is redundant as documentary evidence is needed for validation/verification and crossed checked by the auditors                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Should be removed                                                                                                                                                                                                                                                                                        |
| 3289 | Anonymous            | Table 11, item k)                                                                        |                 | Section 2.2. Paragraph K) requires crediting periods to align with common time frames for the NDCs under the Paris Agreement. It is unclear how the alignment of crediting periods would further integrity and quality in the market. Reporting on progress towards NDCs may occur at any time during a crediting period. This also creates further uncertainty in the market as crediting periods may be of different lengths depending on the start date of each programme.                                                                                                                                                                                                                                                                                                                                                                                                                       | Eliminate requirement                                                                                                                                                                                                                                                                                    |
| 3290 | Gold Standard        | Table 33 a)                                                                              |                 | Welcome the inclusion of dedicated gender policy. It should be extended to VVBs as VVBs are also key stakeholder of the process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Should be revisited as per comment.                                                                                                                                                                                                                                                                      |
| 3290 | Anonymous            | 0                                                                                        |                 | The crediting period requirements are entirely inappropriate for NCS projects, where the length of the crediting period needs to take permanence into account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Re-think any requirements related to NCS (in the entire framework) as this has not been adequately thought through for any provision for any NCS project type other than jurisdictional REDD. A new program of work should be established on this, which involves market stakeholders and the standards. |
| 3291 | Gold Standard        | Table 33 d) & e)                                                                         |                 | The requirement should be revisited as purpose of risk assessment is to ensure unbiased participation, equal opportunities and avoid negative impact. Activity indeed should have measure in place to avoid any risk and ensure equal opportunities are created. Comprehensive gender impact assessment by qualified expert should be needed where activity targets and implement specific impact to make positive impact. The detailed gender impact assessment should be required where activity intend to make and claim positive impact as an outcome of the actions thus considered under SDG impacts.                                                                                                                                                                                                                                                                                         | Should be revisited as per the comment.                                                                                                                                                                                                                                                                  |
| 3291 | Anonymous            | Criterion 13.3: Addressing double claiming of mitigation outcomes with host country NDCs |                 | There is a fundamental difference between compliance and voluntary carbon markets. Participation in VCMs is a voluntary contribution by consumers and corporates in order to compensate for their own carbon footprint, in parallel to reducing as far as possible their actual emissions. The benefit of the VCM is it encourages financial flows towards carbon reduction or removal projects that help Parties to the Paris Agreement (i.e. countries) with an NDC obligation to meet their targets. It is key not to inadvertently disadvantage voluntary actors that are taking climate actions above and beyond what is legally required of them. Designed correctly, the VCM can help countries achieve their goals and use available finance (or even a tax/benefit sharing from projects) to help fund additional ambition.                                                                | Option 2, no provision.                                                                                                                                                                                                                                                                                  |
| 3292 | Gold Standard        | Table 35a)                                                                               |                 | To ensure the alignment with SDG framework, the AF requirements should require quantified SDG impacts aligned with SDG targets.<br>The minimum SDG contributions should be in addition to SDG 13, for example SDG 13+ two other SDGs. AF should look into setting minimum requirements to claim SDG contributions to avoid SDG washing.<br>Robust monitoring and verification of SDG benefits should be included as requirement.<br>Also note that all referred framework doesn't provide a framework to quantify the SDG impact quantification and monitoring. A few of these only provides mapping thus any recommended tools/framework must have clear link of impact with indicators, targets and SDGs for effective quantification and monitoring and to avoid SDGwashing.                                                                                                                     | Should be revisited as per the comment.                                                                                                                                                                                                                                                                  |

| #    | Comment submitted by | Para/Fig/Table/Note                                           | Type of comment | Submitted comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Proposed change                        |
|------|----------------------|---------------------------------------------------------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| 3292 | Anonymous            | 0                                                             |                 | Climate change disproportionately affects the population of developing countries. Exposing activity proponents in the Global South to this additional levy effectively imposes a tax on highly impacted populations to pay for the adaptation to climate change which they are trying to mitigate via their projects. Beyond the distribution effect, it also punishes first movers who are taking action on climate mitigation rather than imposing a levy on actors who continue to emit. It would also direct finance back out of the local communities, to an international body and back to national governments: this is inefficient, wasteful, and rent-seeking. Projects often directly improve adaptation and resilience by changing local livelihoods, diversifying incomes, protecting biodiversity, etc. If anything is to be essentially taxed for adaptation, that is a sovereign decision governments may take. It should not be imposed                                                                                                                                                                        | Do not require share of proceeds.      |
| 3293 | Gold Standard        | Table 35b)                                                    |                 | The SDG framework is designed to make positive impacts via identified targets and monitoring indicators. Safeguards are designed to identify the risk and potential negative impact and avoid, minimise and mitigate where avoidance is not feasible. The activity could indeed have positive and negative impacts, however identification and monitoring of negative impacts via SDG framework is not feasible and practically appropriate when risk assessment against the safeguards is required. The negative impact assessment via SDG framework would complicate the entire assessment when considered. AF should not mix negative and positive impact assessment under SDG framework rather have clear distinction between positive and negative impacts.                                                                                                                                                                                                                                                                                                                                                               | Should be revisited as per the comment |
| 3293 | Anonymous            | Criterion 13.2: Overall mitigation of global emissions (OMGE) |                 | The provisions of the Paris Agreement were designed to govern transactions between state actors and do not explicitly take the financial architecture of VCM into account. Administering such a contribution would be extremely costly and complex to enforce in a voluntary setting. Furthermore, this would increase the risk taken by activity proponents and pose a barrier to entry to the market at a time when we are facing an impending supply shortage. Emphasis should be on accurate accounting, not on arbitrary discounts. This would also essentially be a tax on mitigation that discounts the available finance to help transition local communities to a lower-carbon future.                                                                                                                                                                                                                                                                                                                                                                                                                                | Do not require OMGE                    |
| 3294 | Gold Standard        | Table 35e)                                                    |                 | The requirement is not feasible as the scope of certification ends with registered crediting period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Should be removed                      |
| 3294 | Anonymous            | Option 2                                                      |                 | Requiring host country authorization would effectively hinder host countries from achieving their own NDCs, given that corresponding adjustments would require a deduction from national registries in each instance. Given that the majority of VCM credits today is hosted by developing countries, the notion of requiring corresponding adjustments runs counter to sustainable development and common but differentiated responsibilities principles enshrined in the UNFCCC. IETA does not support the notion that corporate claims constitute double claiming under the Paris Agreement as corporates are non-state actors and therefore not a party to the agreement. Corporate claims are accounted for separately from national claims but may become subject to regulation in VCM host countries or the country where demand side actors are headquartered. Adding an additional requirement under uncertain future policy decisions further complicates market transactions. The VCM offers an opportunity to funnel finance into mitigation that is additional in order to accelerate the transition to net zero. | option 2                               |

| 3295 | Phil Cryle           | QUESTIONS              |                 | <p>The avoidance of leakage is not explicitly set out as one of the Core Carbon Principles, although it does feature under the robust quantification of emission reductions and removals principle, which states indirect impacts must also be included (leakage ; ) where emissions increase outside the boundary of the activity , and in Criterion 10.4 Quantification of leakage emissions . The title of the principle robust quantification of emission reductions and removals suggests that it is primarily concerned with quantifying the gross reduction / removal of emissions from offsetting projects rather than the net reduction / removal, after leakage is accounted for. Given the importance of the issue of leakage avoidance to the actual and perceived integrity of carbon offsetting as a mechanism to reduce global carbon emissions, it could be given greater prominence in the CCPs, even if this is simply by amending the title of the principle to reflect leakage avoidance. The ongoing storage of carbon within natural carbon sinks provides a value to society that is not recognised within the principle of additionality unless there is an emission reduction associated with avoiding an imminent threat of degradation / destruction of a carbon sink. However, proactive conservation of natural carbon sinks is critical to the global carbon budget. The widespread destruction of the global natural environment (Dasgupta Review, 2021) arguably means that all natural carbon sinks are at risk of depletion. Consideration should be given to how the proactive conservation of carbon sinks (where there is no immediate threat of destruction) can be incentivised through the carbon market / CCPs. For example, this could be via payments for the protection of high value carbon sinks (i.e., large tonne CO2e per hectare sites) that have accumulated over thousands of years and cannot be regained once lost. Instead of being considered low-quality on the basis of additionality (i.e., because there is no quantified emission reduction), these projects would enable payments for carbon storage as a critical ecosystem service. This is particularly relevant to jurisdictional REDD+ schemes as the ecosystem services supplied extend beyond national boundaries.</p> | <p>The avoidance of leakage is not explicitly set out as one of the Core Carbon Principles, although it does feature under the robust quantification of emission reductions and removals principle, which states indirect impacts must also be included (leakage ; ) where emissions increase outside the boundary of the activity , and in Criterion 10.4 Quantification of leakage emissions . The title of the principle robust quantification of emission reductions and removals suggests that it is primarily concerned with quantifying the gross reduction / removal of emissions from offsetting projects rather than the net reduction / removal, after leakage is accounted for. Given the importance of the issue of leakage avoidance to the actual and perceived integrity of carbon offsetting as a mechanism to reduce global carbon emissions, it could be given greater prominence in the CCPs, even if this is simply by amending the title of the principle to reflect leakage avoidance. The ongoing storage of carbon within natural carbon sinks provides a value to society that is not recognised within the principle of additionality unless there is an emission reduction associated with avoiding an imminent threat of degradation / destruction of a carbon sink. However, proactive conservation of natural carbon sinks is critical to the global carbon budget. The widespread destruction of the global natural environment (Dasgupta Review, 2021) arguably means that all natural carbon sinks are at risk of depletion. Consideration should be given to how the proactive conservation of carbon sinks (where there is no immediate threat of destruction) can be incentivised through the carbon market / CCPs. For example, this could be via payments for the protection of high value carbon sinks (i.e., large tonne CO2e per hectare sites) that have accumulated over thousands of years and cannot be regained once lost. Instead of being considered low-quality on the basis of additionality (i.e., because there is no quantified emission reduction), these projects would enable payments for carbon storage as a critical ecosystem service. This is particularly relevant to jurisdictional REDD+ schemes as the ecosystem services supplied extend beyond national boundaries.</p> |

| 3296 | Phil Cryle           | QUESTIONS              |                 | <p>Neither Option 1 nor 2 provides certainty with regard to safeguarding against environmental or social harm. For Option 1, the IFC risk categories are ambiguous insofar as the definition of what constitutes potential significant , potential limited and minimal or no adverse environmental or social risks and/or impacts is not precisely specified and does not provide for avenues of risk mitigation under high risk categorised projects is also unclear. Also, the process for assessing compliance with those practices (i.e., is this assessed by the crediting program that issues credits or by the IC-VCM?). For Option 2, relying on alignment with national regulatory frameworks to ensure environmental and social integrity assumes that these frameworks adequately address all potential adverse environmental and social risks and/or impacts, which might not be the case. An alternative approach could be to adopt both (i.e., Option 3) plus a requirement for carbon crediting programs to have third party verification of the environmental and social integrity of projects.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Neither Option 1 nor 2 provides certainty with regard to safeguarding against environmental or social harm. A Programme may not be able to certify the total carbon revenue, project developer business arrangement with its buyers and effective implementation of access and benefit sharing including third party verification.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Suggest to revisit the information and consider voluntary adoption with reduced scope of such mechanism.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3297 | Phil Cryle           | QUESTIONS (second box) |                 | <p>Adherence to a stringent benchmark for these issues from the outset is critical to the actual and perceived integrity of the principles and the carbon market. This should be done in a way that delivers sufficient level of confidence whilst not imposing unnecessary burdens on time/resources. The exception to the implementation of the full threshold from the start for Criterion 7.10. Ensuring net positive SDG impacts which is split by initial and full threshold is deemed to be acceptable given the time it will take carbon-crediting programs to incorporate these requirements (i.e. evidence-driven procedures to ensure consistency with SDG ;s, to provide clear guidance and robust tools for implementing positive SDG actions and to assess and disseminate how types of mitigation activities contribute to SDGs). Further clarity could be provided on how net positive is to be implemented across the SDG ;s and if this involves the quantification of social, environmental and economic outcomes associated with each relevant SDG to have positive net present values.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Adherence to a stringent benchmark for these issues from the outset is critical to the actual and perceived integrity of the principles and the carbon market. The exception to the implementation of the full threshold from the start for Criterion 7.10. Ensuring net positive SDG impacts which is split by initial and full threshold is deemed to be acceptable given the time it will take carbon-crediting programs to incorporate these requirements (i.e. evidence-driven procedures to ensure consistency with SDG ;s, to provide clear guidance and robust tools for implementing positive SDG actions and to assess and disseminate how types of mitigation activities contribute to SDGs). Further clarity could be provided on how net positive is to be implemented across the SDG ;s and if this involves the quantification of social, environmental and economic outcomes associated with each relevant SDG to have positive net present values.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 3298 | Gold Standard        | Table 37 a)                                           |                 | The draft requirement as it is doesn't exclude non-deserving technology types, mitigation options for example treatment of GHGs industrial gases which could likely be non-additional. The EP should develop a list of mitigation options which are not in line with 1.5C targets and exclude from the eligibility list rather using blanket criteria a) for additionality justification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Suggest excluding the step1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3298 | Phil Cryle           | 0                                                     |                 | Whilst Article 6 of the Paris Agreement and the associated corresponding adjustments are intended to be of relevance to the signatories to the Paris Agreement (namely countries and not corporations), there are still reasons why it is useful to provide clarity on how a specific offset can / is being used within a compliance or voluntary market, most obviously because countries are still establishing if voluntary carbon credits can be used towards NDCs. Given the ambiguity regarding the need for corresponding adjustments in the voluntary market (as a result of the Article 6 rulebook not being clear on this), host country authorisation for voluntary offset use (or at least acknowledgement of this potential use), could be a useful requirement of the CCPs if it can be implemented in a way that avoids any adverse dynamics between projects and States. This could be linked to the proposed VCMI labels. Clarity could be provided in the description of the attribution / labelling for offsets authorised for other purposes under Article 6 of the Paris Agreement (as currently described in the CCPs) such as: Authorised for use towards a VCM target only (not a NDC, as this offset might already be claimed towards the host country NDC but represents a contribution claim by a company to that NDC). Authorised for use towards an NDC (host country or another country with a corresponding adjustment). | Whilst Article 6 of the Paris Agreement and the associated corresponding adjustments are intended to be of relevance to the signatories to the Paris Agreement (namely countries and not corporations), there are still reasons why it is useful to provide clarity on how a specific offset can / is being used within a compliance or voluntary market, most obviously because countries are still establishing if voluntary carbon credits can be used towards NDCs. | 3299 | Gold Standard        | 0                                                     |                 | The draft approach is cumbersome and time consuming and will lead to more confusion without much value addition. The step1 should be replaced with a list of negative technologies, measures considering the status and geographic spread and set principles to exclude such mitigation options to avoid locking in emission trajectory that doesn't align with 1.5C target. EP may also set an pre-scheduled frequency to update the negative list going forward to ensure consistency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Suggest to replace the step 1 with a list of negative technologies/mitigation options. EP should conduct a background assessment and seek stakeholder views before adoption of negative list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 3299 | Polly Thompson       | Figure 0.1 – Please answer yes or no                  | No              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3300 | Gold Standard        | Table 38 a) 2 full threshold                          |                 | The draft requirement adds uncertainty and should not be included. Similar to b)2 for initial threshold, an assessment shall be conducted prior to registration and prior to the renewal of the crediting period to confirm that no enforced legal requirements exist that might require the partial or full implementation of the mitigation activity;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Suggest to revisit the requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3300 | Anonymous            | 0                                                     |                 | we strongly encourage the ICVCM to consider the limited capabilities of non-profit independent standards to manage multiple sub-programs within the broader carbon markets. To the extent possible, the ICVCM should evaluate the standards and provide funding and other material support for implementation of the changes required as decided by the ICVCM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | above                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3301 | Gold Standard        | Table 39, Initial                                     |                 | The practical implementation of design requirements i.e., ensuring the publication of document prior to start date is not feasible and would add more confusion. Also, it is not clear if credible third party attestation includes validation by the VVB or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Suggest to revisit the requirements. For example the activity that conducts the consultation with stakeholder prior to start dater (clearly referring to carbon revenue) may be exempted from need to demonstrate carbon revenue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 3301 | Anonymous            | Additionality for project-level mitigation activities |                 | The various approaches to project level additionality assessments proposed, including the unaddressed performance standards/benchmark approach, are all valid methods of determining a project ;s additionality, with pros and cons associated with each approach. We recommend an all of the above approach for demonstrating additionality, as this principle is truly at the core of what makes a legitimate carbon credit. Each project should pass financial additionality, be above certain performance standards, be surplus to legal requirements, and also demonstrate limited penetration/adoption rates. If a project does not meet any one of these criteria, the additionality can be questioned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | above                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 3303 | Gold Standard           | 0                                    |                 | AF should outline the high level requirements outlining the options and safeguards where needed. The detail requirements included for additionality assessment are well established and refined based on two decade of industry experience and would create more confusion. AF may consider alignment with PA especially A6.4 RMPs to ensure consistency across the mechanisms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Suggest to revisit the requirement as per the comment.                                                                                                                        |

| 3304 | Gold Standard           | Table 40 a)                          |                 | a) step 1 is to add a lot of complexity and regulatory burden. As suggested above, step 1 can be replaced with a negative list of project activities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Suggest to remove step 1 from requirements and replaced with negative list.                                                                                                   |
| 3304 | Anonymous               | 0                                    |                 | <p>Dear Members of the Integrity Council for the Voluntary Carbon Market. XXXX acknowledges the huge amount of work, discussion and engagement undertaken by the IC VCM over the past months. XXXX shares the IC VCM ;s goal of delivering high-quality carbon credits that create real, additional and verifiable climate impact with high environmental and social integrity . We note with some concern that the IC VCM contains limited representation from the market, and carbon credit project developers in particular. XXXX seeks to attempt to address this gap in our comments below &amp;ndash; we offer a from the coal face ; perspective based on collectively decades of experience in developing carbon offset projects and delivering carbon credits representing real and additional emission reductions/ removals; alongside, in many cases, additional co-benefits to some of the most vulnerable communities in the world. To start, we have some general remarks on the IC VCM: First, we see a potential conflict of interest if not all existing VCM Standards / carbon registries have the chance to be represented on the Council and are concerned that this may result in CCPs that may be biased towards one existing Standard. We are also concerned by the lack of project developer / proponent representation in the decision-making processes Second, we see potential contradictions of the evolving principles and the assessment framework with domestic and sectoral GHG programmes using voluntary carbon credits. Many of these programmes have spent valuable years and resources addressing some of the concerns raised now by the IC VCM. Many specific and targeted measures have been developed to address these concerns. We recognise the requirement for continuous improvement however we believe the IC VCM ;s proposed position &amp;ndash; as a global authority on what constitutes a quality carbon credit/ GHG programme &amp;ndash; will undermine market confidence. Reduced investor and stakeholder confidence will create barriers to the development of the climate projects that are required to mitigate global climate change. This will result in increased climate impacts, likely to disproportionately affect developing communities compared to more developed communities that have arguably contributed the most to global GHG emissions. Thirdly, we are concerned that a new costly overhead may be created that in the end has to be paid by those who do the work on the ground &amp;ndash; the project developers. The carbon market is identified as one of the key mechanisms by which the private sector will deliver climate finance to emerging markets, in particular. And the gap in climate finance needed for many countries to meet Paris Alignment goals is substantial &amp;ndash; in Africa alone USD 2.8 trillion is needed between 2020 and 2030, compared to just USD 30 billion received annually currently[1]. Raising barriers to entry to the carbon markets and increasing transaction costs will, we believe, make it more difficult for projects</p> | We have general comments - please see aboce. It seems the saving of the concrete comments per question did not work, so we try again this way.                                |

| 3305 | Gold Standard             | 0                                                                             |                 | AF should clarify if the permanence requirement for sequestration activities for example Soil organic carbon. The proposed monitoring approaches are not practical for such activities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Suggest to add more clarity.                     |
| 3305 | Anonymous                 | Table 35 – Requirements for Criterion 7.10: Ensuring net positive SDG impacts |                 | Contribution to SDGs as a co-benefit is important, but it is not appropriate to make it a requirement of the reduction project, since it is a consequence and by-products. There seems to be no established methodology to evaluate the net positive impact of SDGs, which is the sum of positive and negative impacts. This is an excessive requirement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Deletenet and change fromensuring tocontributing |
| 3306 | Gold Standard             | 0                                                                             |                 | “The GHG emission reductions or removals from the mitigation activity shall be permanent, or if they have a risk of reversal, any reversals shall be fully compensated.” The compensation guarantee from project developers may not work in certain cases such as the proponent abandoning the project without declaring so. This has happened in AR CDM projects                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Suggest to revisit the requirement               |
| 3307 | Gold Standard             | Table 45 full threshold a)                                                    |                 | Mitigation activity proponents to sign legal agreements obligating them to monitor, report and compensate for avoidable reversals for the full commitment period. Commitment period is different from the crediting period and would be in excess to crediting period in some cases. It may not be practical for project proponents to have such a long-term arrangement / legal agreement in place.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                                |
| 3307 | Anonymous                 | 0                                                                             |                 | Post-evaluation monitoring would be desirable, but would require a huge human resource and a large amount of cost for implementing monitoring for many years. It would be costly and would reduce the funds for reduction projects when it charges to project developers. Although it is necessary, it may be better to consider simplification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | No specific language proposed                    |
| 3308 | Gold Standard             | Table 45 full threshold a)                                                    |                 | To demonstrate sufficiency of compensation mechanism the contributions to the buffer reserve should always be based on a robust assessment of non-permanence risk, and there should be clear scientific evidence to support the % contributions that are decided. Expectation on Robust assessment of risk is not clear. Scientific evidence on risk propensity may not be available in cases. In absence of credible evidence, the risk assessment would be a checkbox exercise. Thus, in cases where quantification of risk is not possible, an appropriate contribution to buffer should be fixed to ensure consistency for given activity types.                                                                                                                                                                                                                                                                       | 0                                                |
| 3308 | Tanya Santalahti          | Figure 0.1 – Please answer yes or no                                          |                 | No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | No                                               |
| 3309 | Gold Standard             | 0                                                                             |                 | As an alternative to monitoring and compensation for reversals, temporary crediting is also allowed. AF should clarify if expiring credits be replaced by other expiring credits?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 0                                                |
| 3309 | Tanya Santalahti          | 0                                                                             |                 | Nature-based solutions that increase soil organic carbon (SOC) are essential in achieving the goal of the 4 per 1000 initiative, which is creating carbon-rich soils that allow us to combat climate change and end hunger. However, due to the nature of SOC dynamics, its permanence is shorter than what is typically expected in the VCM. Globally, the length of soil organic carbon-based removal projects is only set to 5-15 years. In the discussion of setting requirements for permanence in agricultural carbon removal projects, it is vital to distinguish the challenges of increasing SOC in agriculture with a permanence of 100+years. When setting permanence demands, the risk of losing reliable projects with lower permanence must be weighed. Allowing projects with shorter, but still ambitious, permanence (e.g. 20 years) would make sure that all relevant means are used for increasing SOC. | n/a                                              |

| 3313 | Gold Standard        | 0                                    |                 | AF shall define the maximum duration of all crediting periods to ensure consistency and alignment with PA – particularly A6.4RMPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 0                                                                                                                                                                           |
| 3313 | Anonymous            | 0                                    |                 | We like the idea of phasing implementation to Phase 1(initial) and Phase2 (full). Some thinks related to social and biodiversity benefits could be pushed for phase 2 (full), and clearly focus to climate actions and carbon accounting in phase 1 (initial).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Some thinks related to social and biodiversity benefits could be pushed for phase 2 (full), and clearly focus to climate actions and carbon accounting in phase 1 (initial) |
| 3314 | Gold Standard        | Table 50                             |                 | Welcome the requirements for alignment with net zero emissions. The proposed requirements are high level and should be further substantiated with example and must consider the host country, technology specific circumstances to avoid conflict with right to development principle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                                                                                                                                                           |
| 3315 | Gold Standard        | 0                                    |                 | Agree with the proposal. However we recommend that EP consider the established approaches rather reinventing the wheel and disrupting ongoing development. GS has an established approach designed and developed with input from various stakeholders including developers and expert stakeholders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0                                                                                                                                                                           |
| 3316 | Gold Standard        | General                              |                 | <p>Cover statement</p> <p>If the voluntary carbon market is to play an enduring, stable, and impactful role in global efforts to address greenhouse gas emissions, its growth must be based on firm foundations of quality and integrity. Gold Standard welcomes the proposals put forward by the Integrity Council for the Voluntary Carbon Market (IC-VCM) as a positive step towards achieving this objective. We are pleased to share with the IC-VCM Secretariat our overall assessment of its purpose and proposals, as well as areas where we believe the proposals could be further strengthened or where modifications are required.</p> <p>Overall assessment</p> <p>For nearly twenty years, Gold Standard has sought to support and enable projects that represent the highest levels of quality and at the same time contribute to sustainable development. In this time, we have continuously sought to evolve in line with best practice and science, to maintain and strengthen the rigour of our work, and to retain the trust of market actors in the process that we oversee and the credits that we issue.</p> <p>The market is at a critical turning point, with increased scrutiny from market actors and from regulators, new norms and requirements stemming from the implementation of the Paris Agreement, and an opportunity to play a significant role in global decarbonisation efforts if we get the fundamentals right.</p> <p>In this context, we increasingly see the importance of the IC-VCM to ensure high standards and provide a benchmark for quality across the market, and to shine a spotlight on entities issuing credits that do not meet this benchmark. We do not have time for the trust of those willing to invest to be shaken by standards and methodologies that fall short of where we should be.</p> <p>The role of crediting standards is not an easy one, and it will not be made easier by the introduction of a new governance body and the rigorous requirements proposed by the IC-VCM. It is though our view that this is as it should be. Carbon credits are not a tangible asset that can be held and examined. They are instruments based on trust: trust in the rigour of a standard’s procedures and requirements, of a project developer’s monitoring and activity, and a verifier’s due diligence. all which are complex and difficult for non-experts to understand. We believe that the</p> | 0                                                                                                                                                                           |

| 3317 | Gold Standard        | General             |                 | <p>Detailed comments</p> <p>1. Enabling implementation and action, rather than holding this back</p> <p>As is reflected in this consultation response, Gold Standard welcomes the role that the IC-VCM and the CCPs can play to provide assurance of quality in the carbon market. However, the right balance has to be struck between rigour on the part of the IC-VCM's through its framework, and flexibility for standards to innovate, to move quickly, and to improve and simplify rules and procedures. On this topic, we would like to give the following main recommendations:</p> <p>A. At various public and private events, it has been shared that the initial CCPs are a starting point on the road to further ratcheting of quality, ambition and integrity. Whilst at one level Gold Standard supports this, it is important to relate this to the specific use case of offsetting, which is the IC-VCM's stated aim. Offsetting requires, in order to be 'true', that each CCP is met in such a way that the claim to have offset is ultimately delivered. Going beyond this threshold, in some cases, will not mean 'more' offsetting has happened and thus becomes a driver of inefficiency. For example, if it is deemed (illustratively) that we should be 80% certain or more to safeguard the claim of offsetting, then ratcheting to 90% is simply adding unnecessary cost. We would recommend therefore focusing as much on delivering 80% more efficiently as on ratcheting to 90%, in this example.</p> <p>B. Many of the governance-related requirements proposed by the IC-VCM are directly relevant to the processes that lead to high-quality credits. However, we consider others to go beyond the mandate of the IC-VCM, as a body focused primarily on credit-level quality, and we are wary about their adoption where they may prove difficult to abide by. For instance, a requirement to publish minutes of governing body meetings may act to stifle the frank and open discussion amongst members that is needed for robust and inclusive decision-making.</p> <p>C. Well-run standards have in place robust procedures to design approaches for the assessment of additionality and the adoption of new methodologies, which involve input from recognised experts. Rather than acting as an additional regulatory hurdle for the adoption of new methodologies or approaches, and contributing to delays, we believe the IC-VCM could choose to work with standards as stakeholders within their processes. This way of working could both bring efficiency and lead to better outcomes. A good example of this ethos can be found in the governance and membership of the ISEAL Alliance, of which Gold Standard is a member. This more</p> | 0               |

| 3318 | Gold Standard        | General             |                 | <p>2. Accessibility and safeguarding the interests of vulnerable communities</p> <p>Whilst acknowledging the importance and benefits associated with the CCPs, it must also be acknowledged that they will inevitably add cost and resource burden to the market. Gold Standard encourages the IC-VCM to take into consideration the following issues:</p> <p>A. It is important to be able to 'grandfather' good projects that are part of the existing portfolios of market standards, such that they can achieve the IC-VCM label. Vulnerable projects (i.e., those that might fail without market support) should be prioritised, particularly those in developing countries. It would not be fair to exclude good projects in these areas simply because of their timing. Indeed, there would be no market without them, and it would send an unsettling and counterproductive signal. We recommend that a procedure for existing projects is added, including how to deal with timebound CCPs that cannot be dealt with retroactively. This isn't simply a matter of inclusivity; the CCPs will inevitably be a factor in carbon credit pricing and buyer preferences.</p> <p>B. The added costs of the CCPs can only be borne to a certain extent by the standards. It is inevitable therefore that some may be passed to participants, which may be unfair particularly for developing country / vulnerable community projects. The costs associated with the assessment procedure are not currently clear, but Gold Standard urges IC-VCM to carefully consider this in relation to projects that are already in hard to reach and challenging conditions, as these are the areas in most need of financial support. We would also recommend considering each CCP in light of Least Developed Country conditions and whether there can be any easing of requirements and/or processes reflective of the challenges faced in those contexts. Gold Standard has extensive experience of this and has demonstrated that this can work.</p> <p>C. The stated aim of the IC-VCM documentation is to set out CCPs that, in summation and packaged as a credit, lead to support of the claim to have offset/compensated an emission elsewhere. We understand the logic behind using this as an initial benchmark. However, we note that use of the voluntary carbon market is already beginning to move beyond offsetting, with some companies seeking to make alternative claims without such a direct compensatory claim. The aim of the IC-VCM may act to skew the types of activities supported through the carbon market towards those most able to meet the CCPs rather than those most important to support, which may be suitable for other non-offsetting forms of voluntary use of the carbon market. We would like to see greater acknowledgement of this in surrounding communications, to ensure this is well</p> | 0               |

| 3319 | Gold Standard        | General             |                 | <p>3. Alignment with, and best practice under, the Paris Agreement and 2030 Agenda for Sustainable Development</p> <p>While the voluntary carbon market may not be directly regulated by the Paris Agreement, it clearly exists and operates within an international policy framework that is defined by it. It is therefore important that the voluntary carbon market aligns with the new context under the Paris Agreement in order to uphold its rigour, for instance with respect to additionality and baseline-setting. We also consider it sensible to align with design features of the new crediting mechanism under Article 6.4, to help build towards a global, harmonised carbon market. We welcome the fact that these goals have been reflected in different parts of the IC-VCM proposals.</p> <p>The IC-VCM presented options for three issues related to alignment with the Paris Agreement: share of proceeds for adaptation finance, overall mitigation in global emissions and the application of corresponding adjustments under Article 6.</p> <p>With respect to the first two of these, adaptation finance and overall mitigation in global emissions, Gold Standard is of the view that the voluntary carbon market should respect the decision taken by Parties at COP27, and in particular the strong encouragement placed on Parties and stakeholders to contribute to both goals when using mitigation outcomes authorised under Article 6.2. We intend to consult on the following approach to this topic in the near future, developed through discussion with our Expert Group on Alignment with the Paris Agreement:</p> <ol style="list-style-type: none"> <li>1. For credits authorised under Article 6.2 of the Paris Agreement, set a default that 2% of credits will be cancelled at issuance to deliver overall mitigation of global emissions and 5% diverted for sale to fund adaptation, but give project developers the option to receive full issuance without application of these levies (subject to point 3 below).</li> <li>2. For credits not authorised under Article 6.2, set a default that no credits are cancelled at issuance or diverted for sale to fund adaptation (subject to point 3 below), but give project developers the option to request application of these levies.</li> <li>3. Respect any regulations or requests set by a project's host country that require that credits must be cancelled to deliver overall mitigation of global emissions or diverted to fund adaptation, whether or not the credits are authorised under Article 6.2.</li> <li>4. Add identifiers in the registry to signal contributions to adaptation finance and overall mitigation in global emissions.</li> </ol> | 0               |
| 3320 | Gold Standard        | General             |                 | <p>With respect to corresponding adjustments, it is our hope that the IC-VCM is able to rise above the contention associated with this topic, and to find an approach to the risk of displacement or deferral of mitigation action that is as robust as the proposals it has made in other areas. The IC-VCM's framework exists in order to provide assurance of the quality of carbon credits for offsetting purposes, with safeguards to ensure that any risks to the integrity of credits are comprehensively addressed. If the IC-VCM is not able to include safeguards that manage the risk of displacement or deferral of mitigation action towards the host country's NDC - recognising that the extent of this risk will be variable across scenarios - then its work will be incomplete. See also below for further comments on double counting.</p> <p>With respect to sustainable development, which is treated as an additional attribute, programmes must be expected to apply robust quantification, monitoring and verification of SDG impacts as a condition for indicating credits as holding this additional attribute. This is needed to avoid SDG-washing, and to provide more consistency across the market in how and when SDG impacts can be associated with projects and credits. See also below for further detailed comments on sustainable development and safeguarding.</p> <p>In addition, we encourage the IC-VCM in addition to consider aligning maximum crediting period limits with those set under the new crediting mechanism established by Article 6.4, to ensure consistency in approach.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0               |

| 3321 | Gold Standard        | General             |                 | <p>4. Alignment with the 1.5oC temperature goal and avoiding the lock-in of emissions</p> <p>The voluntary carbon market's value is in enabling the adoption of technologies and practices that reduce or remove emissions and bring the world closer to achieving the temperature goal adopted under the Paris Agreement. It should not serve to perpetuate technologies and practices that involve continued emissions that could put achievement of this temperature goal at risk.</p> <p>Gold Standard therefore welcomes the IC-VCM's proposal to consider and assess the consistency of technologies with a net-zero emission goal by mid-century. However, rather than the proposed approach of assessing each mitigation activity under programmes, we recommend that the IC-VCM establishes a dynamic 'negative list' of technologies/mitigation activities that are deemed incompatible with the net-zero emission goal. This should take into account regional differences where appropriate, and be reassessed and updated regularly, for instance every five years.</p> <p>This approach would achieve the objective sought by the IC-VCM and provide a clear, consistent, market-wide signal while avoiding additional administrative burdens to standards and developers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 0               |
| 3322 | Gold Standard        | General             |                 | <p>5. Robust approaches to sustainable development and safeguarding</p> <p>Gold Standard welcomes the inclusion of both safeguarding principles and contribution to sustainable development, both of which are also important parts of alignment with the Paris Agreement. On this topic, we would like to share the following comments:</p> <p>A. The references cited for safeguards, for example to IFC and UNDP standards, are useful and relevant. However, from our experience it is not possible to simply point to these standards as they are not governed by our scheme and are not written in standards language that can easily be adopted and verified. Gold Standard reinterpreted these and others to be fit for our purpose, and we have therefore clearly demonstrated that this is possible. We recommend that the CCPs state clearly that a conversion / adoption process should be implemented, rather than a simple reference to third party standards.</p> <p>B. We also advise IC-VCM to be sure that it is itself protected from poor safeguarding implementation, and that it gives itself the ability to withdraw approvals where necessary, including retroactively.</p> <p>C. Sustainable development contributions and co-benefits should be stated explicitly and publicly by all projects and programmes, even where either none is achieved or no MRV is in place. Those projects that do contribute positively should then receive a 'CCP+' tag for sustainable development. In this way the CCP becomes part-mandatory (though with no 'fail' threshold for sustainable development contributions, simply disclosure) and part-additive. This would ensure that projects that make no effort to contribute to sustainable development or no effort to have their efforts assured cannot make unverified claims to the market, in association with the IC-VCM name and brand. It also helps to more clearly differentiate those projects that do contribute, allowing them to justifiably attract a higher market value.</p> | 0               |

| 3323 | Gold Standard        | General             |                 | <p data-bbox="902 281 1092 310">6. Double counting</p> <p data-bbox="902 310 1816 583">A unique claim, i.e. only one claimant uses the benefit associated with a credit against one target/claim, is an essential principle of offsetting. Without it, i.e. where the benefit is used by two or more claimants for any reason, the claim to have offset is no longer secure. This is because neither the first claimant nor the credit issuer can guarantee how further claimants will respond to the 'free' benefit handed to them and thus it is as likely that the credit offsets their emissions as the originally intended claimants. A good example of this would be the South Africa carbon tax, where the emissions being offset are not the purchasing companies but emissions elsewhere in the South African NDC. In this example this is intentional and acceptable, but it is often conflated with a company level claim to have offset emissions, which is not true.</p> <p data-bbox="902 615 1816 730">The CCPs correctly identify the three forms of double counting that can lead to the scenario of failure to offset the target emissions. The first two – double issuance and double use are well-covered and we expect little further effort to address. Double claiming however is poorly explained and poorly covered.</p> <p data-bbox="902 762 1816 1003">In the current market environment there are two forms of double claiming that are particularly challenging that have not been an issue for historic markets, namely with host country NDCs and with voluntary company inventories (such as via Science Based Targets). The former can and should be dealt with via either a Corresponding Adjustments or through a non-offset claim which does not require a unique claim. The latter - as stated in a recent guidance from the Greenhouse Gas Protocol (see Chapter 13) - should be similarly adjusted for by the reporting company. Gold Standard recognises that the latter especially may not be in the gift of either projects or standards to administer.</p> <p data-bbox="902 1035 1816 1182">Accordingly, we recommend a much stronger definition and rationale for the issues caused by double claiming, a clear statement of these two forms, and a clear position on them by IC-VCM. This may be to say that IC-VCM recognises them as issues but considers them to be buy-side consideration. However, stating that the issues are not settled or are contentious is technically unsound and diminishes the stated aim to bring integrity to the market.</p> <p data-bbox="902 1213 1816 1239">We look forward to further dialogue with the IC-VCM Secretariat and Expert Panel on these and</p> | 0               |
